1 The People of the State of California, by and through Rob Bonta, the Attorney General of
2 California, allege as follows:

3 **I. INTRODUCTION**

4 1. In 2023 alone, the State of California has endured both extreme drought and
5 widespread flooding, sprawling wildfires and historic storms, and an unusually cold spring and a
6 record-hot summer. These extremes are devastating the State and destroying people’s lives and
7 livelihoods, and they are accelerating. These extremes are the products of climate change, and
8 climate change is the product of widespread combustion of fossil fuels. Oil and gas company
9 executives have known for decades that reliance on fossil fuels would cause these catastrophic
10 results, but they suppressed that information from the public and policymakers by actively
11 pushing out disinformation on the topic. Their deception was rewarded with tremendous revenues
12 and profits, while causing a delayed societal response to global warming. And their deception
13 continues to this day, with these companies now misleadingly promoting their businesses as
14 responsible environmental citizens focused on offering solutions to climate change. The
15 companies’ misconduct has resulted in tremendous costs to people, property, and natural
16 resources, which continue to unfold each day. Californians and their families, communities, and
17 small businesses should not have to bear all the costs of climate change alone; the companies that
18 have polluted our air, choked our skies with smoke, wreaked havoc on our water cycle, and
19 contaminated our lands must be made to mitigate the harms they have brought upon the State.
20 This lawsuit seeks to hold those companies accountable for the lies they have told and the damage
21 they have caused.

22 2. The People of the State of California (State)¹ bring this action against Defendants
23 Exxon Mobil Corporation; ExxonMobil Oil Corporation; Shell plc; Shell USA, Inc.; Shell Oil
24 Products Company LLC; Chevron Corporation; Chevron U.S.A. Inc.; ConocoPhillips;
25 ConocoPhillips Company; Phillips 66; Phillips 66 Company; BP p.l.c.; BP America Inc.;

26 ¹ In this Complaint, the term “State” refers to the State of California, unless otherwise
27 stated. The term “California” refers to the area falling within the State’s geographic boundaries,
28 unless otherwise stated. The State expressly disclaims injuries arising on federal land and tribal
lands held in trust by the United States and does not seek recovery or relief attributable to these
injuries.

1 American Petroleum Institute, and Does 1 through 100 (collectively, Defendants) for creating,
2 contributing to, and/or assisting in the creation of state-wide climate change-related harms in
3 California. As more fully alleged below, Defendants created, contributed to, and/or assisted in the
4 creation of a public nuisance, and harmed or destroyed natural resources.

5 3. Defendants are large companies in the fossil fuel industry who have misled
6 consumers and the public about climate change for decades. Defendants have known since at least
7 the 1960s that fossil fuels produce carbon dioxide and other greenhouse gas (GHG) pollution that
8 would warm the planet and change our climate. Defendants' own scientists knew as early as the
9 1950s that these climate impacts would be catastrophic, and that there was only a narrow window
10 of time in which communities and governments could take action before the consequences
11 became catastrophic.

12 4. Rather than warn consumers, the public, and governments, however, Defendants
13 mounted a disinformation campaign beginning at least as early as the 1970s to discredit the
14 burgeoning scientific consensus on climate change; deny their own knowledge of climate change-
15 related threats; create doubt in the minds of consumers, the media, teachers, policymakers, and
16 the public about the reality and consequences of the impacts of burning fossil fuels; and delay the
17 necessary transition to a lower-carbon future.

18 5. Defendants' climate deception campaign, and aggressive promotion of the use of
19 fossil fuel products while knowing the dangers associated with them, had the purpose and effect
20 of unduly and substantially inflating and sustaining the market for fossil fuels, and therefore the
21 Fossil Fuel Defendants' profits, while misrepresenting and concealing the hazards of those
22 products to deceive consumers and the public about the consequences of everyday use of fossil
23 fuel products. Defendants' tortious and deceptive conduct caused an enormous, foreseeable, and
24 avoidable increase in anthropogenic GHG emissions and accelerated global warming, bringing
25 devastating consequences to the State and its people. While Defendants have promoted and/or
26 profited from the extraction and consumption of fossil fuels, the State and its residents have spent,
27 and will continue to spend, billions of dollars to recover from climate change-induced
28 superstorms and wildfires; will have to allocate and manage dwindling water supplies in extreme

1 drought; will have to fortify state infrastructure against sea level rise and coastal and inland
2 flooding; and will have to protect California’s people, infrastructure, and natural resources from
3 extreme heat and many other climate change hazards.

4 6. Defendants’ deceptive and tortious conduct was a substantial factor in bringing about
5 these devastating climate change impacts in California, including, but not limited to, extreme
6 heat, more frequent and intense droughts, increasingly severe wildfires, more frequent and intense
7 storms and associated flooding, degradation of air and water quality, damage to agriculture, sea
8 level rise, and habitat and species loss. As a direct result of Defendants’ egregious misconduct,
9 the State has incurred significant climate change harms, and will continue to incur such harms
10 into the future. The associated consequences of these physical and environmental changes are felt
11 throughout every part of the State, across all ecosystems and communities, and can be
12 compounded in frontline communities, which often disproportionately bear the burden of climate
13 impacts.²

14 7. Defendants’ individual and collective conduct was a substantial factor in bringing
15 about the State’s climate-related injuries. Defendants’ knowing concealment and
16 misrepresentation of fossil fuels’ dangers—together with the affirmative promotion of
17 unrestrained fossil fuel use—drove fossil fuel consumption and delayed the transition to a lower-
18 carbon future, resulting in greater greenhouse gas pollution, accelerated global warming, and
19 more dire impacts from the climate crisis in California and elsewhere.

20 8. The scale of the devastating public nuisance created by Defendants’ egregious
21 misconduct is truly staggering, and California will be dealing with the consequences of this
22 misconduct for many generations. The State respectfully requests that this Court order Defendants
23 to abate the massive public nuisance they created, contributed to, and/or assisted in the creation
24 of, and that this Court use its equitable powers to order Defendants to mitigate future harm to the
25 environment and people of California attributable to Defendants’ unlawful actions, including, but
26 not limited to, by granting preliminary and permanent equitable relief. The State further

27 ² “Frontline communities” are those that are and will continue to be disproportionately
28 impacted by climate change. In many cases, the most harmed are the same communities that have
historically experienced racial, social, health, and economic inequities.

1 respectfully requests that this Court order Defendants to pay damages, statutory penalties,
2 restitution, and disgorgement.

3 **II. PARTIES**

4 **A. Plaintiff**

5 9. Plaintiff is the People of the State of California. This civil enforcement action is
6 prosecuted on behalf of the People by and through Rob Bonta, Attorney General of California,
7 under the Attorney General's broad independent powers to enforce state laws (Cal. Const., art. V,
8 § 13), and pursuant to Government Code sections 12527.6 and 12600 et seq.; Civil Code sections
9 3479, 3480, 3491, and 3494; Business and Professions Code sections 17203, 17204, 17206,
10 17535, and 17536; and Code of Civil Procedure sections 731 and 1021.8.

11 **B. Defendants**

12 10. Defendants include some of the largest oil and gas companies in the world, and a
13 national oil and gas industry trade association. The fossil fuels produced by the defendant
14 companies (and promoted by the defendant trade association) are individually and collectively
15 responsible for the emission of billions of tons of greenhouse gases.

16 11. When this Complaint references an act or omission of Defendants, unless specifically
17 attributed or otherwise stated, such references mean that the officers, directors, agents,
18 employees, or representatives of Defendants committed or authorized such an act or omission, or
19 failed to adequately supervise or properly control or direct their employees while engaged in the
20 management, direction, operation or control of the affairs of Defendants, and did so while acting
21 within the scope of their employment or agency.

22 12. **Exxon Entities: Exxon Mobil Corporation; ExxonMobil Oil Corporation**

23 a. Defendant Exxon Mobil Corporation is a New Jersey corporation headquartered
24 in Spring, Texas, and has been registered to do business in California since 1972. Exxon Mobil
25 Corporation is a multinational, vertically integrated energy and chemical company and one of the
26 largest publicly traded international oil and gas companies in the world. Exxon Mobil
27 Corporation was formerly known as, did or does business as, and/or is the successor in liability to
28 Exxon Corporation; ExxonMobil Refining and Supply Company; Exxon Chemical U.S.A.;

1 ExxonMobil Chemical Corporation; ExxonMobil Chemical U.S.A.; ExxonMobil Refining &
2 Supply Corporation; Exxon Company, U.S.A.; Standard Oil Company of New Jersey; and Mobil
3 Corporation.

4 b. Defendant ExxonMobil Oil Corporation is a wholly owned subsidiary of Exxon
5 Mobil Corporation, acts on Exxon Mobil Corporation’s behalf, and is subject to Exxon Mobil
6 Corporation’s control. ExxonMobil Oil Corporation is a New York corporation headquartered in
7 Spring, Texas, and has been registered to do business in California since 1959. ExxonMobil Oil
8 Corporation was formerly known as, did or does business as, and/or is the successor in liability to
9 Mobil Oil Corporation. ExxonMobil Oil Corporation is engaged in the business of oil and natural
10 gas production, refining, marketing, and distribution.

11 c. Exxon Mobil Corporation controls and has controlled company-wide decisions
12 about the quantity and extent of fossil fuel production and sales, including those of its
13 subsidiaries. Exxon Mobil Corporation’s 2022 Form 10-K filed with the United States Securities
14 and Exchange Commission represents that its success, including its “ability to mitigate risk and
15 provide attractive returns to shareholders, depends on [its] ability to successfully manage [its]
16 overall portfolio, including diversification among types and locations of [its] projects, products
17 produced, and strategies to divest assets.” Exxon Mobil Corporation determines whether and to
18 what extent its subsidiaries market, produce, and/or distribute fossil fuel products.

19 d. Exxon Mobil Corporation controls and has controlled company-wide decisions,
20 including those of its subsidiaries, related to marketing, advertising, GHG emissions and climate
21 change resulting from the company’s fossil fuel products, and communications strategies
22 concerning climate change and the link between fossil fuel use and climate-related impacts on the
23 environment and humans. Exxon Mobil Corporation’s Board holds the highest level of direct
24 responsibility for climate change policy within the company. Exxon Mobil Corporation’s
25 Chairman of the Board and Chief Executive Officer, its President, and the other members of its
26 Management Committee have been actively engaged in discussions relating to GHG emissions
27 and the risks of climate change on an ongoing basis. Exxon Mobil Corporation requires its
28

1 subsidiaries, when seeking funding for capital investments, to provide estimates of project costs
2 related to GHG emissions.

3 e. Defendants Exxon Mobil Corporation, ExxonMobil Oil Corporation, and their
4 predecessors, successors, parents, subsidiaries, affiliates, and divisions, are collectively referred
5 to herein as “Exxon.”

6 f. The State’s claims against Exxon arise out of and are related to the acts and
7 omissions of Exxon in California and elsewhere that caused and will cause injuries in California.

8 g. Exxon consists of numerous divisions and affiliates in all areas of the fossil fuel
9 industry, including exploration for and production of crude oil and natural gas; manufacture of
10 petroleum products; and transportation, promotion, marketing, and sale of crude oil, natural gas,
11 and petroleum products. Exxon is also a major manufacturer and marketer of commodity
12 petrochemical products.

13 h. Exxon has purposefully directed its tortious conduct toward California by
14 distributing, marketing, advertising, promoting, and supplying its fossil fuel products in
15 California, with knowledge that the intended use of those products for combustion has caused and
16 will continue to cause climate change-related harms in California, including the State’s injuries.
17 Exxon’s statements in California and elsewhere made in furtherance of its campaign of deception
18 about and denial of climate change, and Exxon’s affirmative promotion of its fossil fuel products
19 as safe with knowledge of how the intended use of those products would cause climate change-
20 related harms, were designed to conceal and mislead consumers and the public, including the
21 State and its residents, about the serious adverse consequences that would result from continued
22 use of Exxon’s products. That conduct was purposefully directed to reach and influence the State
23 and its residents to continue unabated use of Exxon’s fossil fuel products in California, thereby
24 resulting in the State’s injuries.

25 i. Over the past several decades and continuing to the present day, Exxon spent
26 millions of dollars on radio, television, online, social media, and outdoor advertisements in the
27 California market related to its fossil fuel products. Since at least 1972, and continuing to the
28 present day, Exxon has advertised its fossil fuel products in print publications circulated widely to

1 California consumers, including but not limited to: *The Atlantic*, *Life*, *National Geographic*, *The*
2 *New York Times*, *People*, *Sports Illustrated*, *Time*, *The Wall Street Journal*, and *The Washington*
3 *Post*. Exxon has also run advertisements in California media outlets, including but not limited to
4 the following: CBS 5 San Francisco, KRLA-AM, *The Sacramento Bee*, *San Francisco Examiner*,
5 *The Santa Rosa Press Democrat*, *SFGate.com*, and *Sonoma Magazine*. As further detailed herein,
6 these include advertisements containing false or misleading statements, misrepresentations,
7 and/or material omissions designed to hide the connection between the production and use of
8 Exxon's fossil fuel products and climate change, and/or misrepresenting Exxon's products or
9 Exxon itself as environmentally friendly.

10 j. Significant quantities of Exxon's fossil fuel products are or have been
11 transported, traded, distributed, promoted, marketed, manufactured, sold, and/or consumed in
12 California, from which activities Exxon derives and has derived substantial revenue. Exxon owns
13 and operates a petroleum storage and transport facility in the San Ardo Oil Field in San Ardo,
14 California. Exxon and its predecessors owned and operated an oil refinery in Torrance, California
15 from 1966 to 2016, shortly after an explosion disabled the refinery. Exxon Co. USA, an
16 ExxonMobil subsidiary, operated a petroleum refinery in Benicia, California, from 1968 to 2000.
17 Exxon also—both directly and through its subsidiaries and/or predecessors-in-interest—has
18 supplied substantial quantities of fossil fuel products to California during the period relevant to
19 this Complaint. Currently, Exxon promotes, markets, and sells gasoline and other fossil fuel
20 products to California consumers through approximately 600 Exxon- and Mobil-branded
21 petroleum service stations in California. During the period relevant to this Complaint, Exxon sold
22 a substantial percentage of all retail gasoline in California. Exxon also markets and sells
23 petroleum products, including engine lubricants and motor oils sold under the "Mobil 1" brand
24 name, to California customers through local retailers.

25 k. Exxon historically directed its fossil fuel product advertising, marketing, and
26 promotional campaigns to California residents, including through maps that identify the locations
27 of its service stations in California. To this day, Exxon continues to market and advertise its fossil
28 fuel products in California to California residents by maintaining an interactive website available

1 to prospective customers that directs California residents to Exxon’s nearby retail service stations
2 and lubricant distributors. Further, Exxon promotes its products in California by regularly
3 updating and actively promoting its mobile device application, “Exxon Mobil Rewards+,”
4 throughout the State of California, which encourages California users to consume fuel at Exxon
5 stations in California in exchange for rewards on every fuel purchase.

6 13. **Shell Entities: Shell plc; Shell USA, Inc.; Shell Oil Products Company LLC**

7 a. Defendant Shell plc (formerly Royal Dutch Shell PLC) is a vertically integrated
8 multinational energy and petrochemical company. Shell plc is incorporated in England and
9 Wales, with its headquarters and principal place of business in The Hague, Netherlands. Shell plc
10 is the ultimate parent company of numerous divisions, subsidiaries, and affiliates, referred to
11 collectively as the “Shell Group,” that engage in all aspects of fossil fuel production, including
12 exploration, development, extraction, manufacturing and energy production, transport, trading,
13 marketing, and sales.

14 b. Shell plc controls and has controlled company-wide decisions about the
15 quantity and extent of fossil fuel production and sales, including those of its subsidiaries. Shell
16 plc’s Board of Directors determines whether and to what extent Shell subsidiary holdings around
17 the globe produce Shell-branded fossil fuel products.

18 c. Shell plc controls and has controlled company-wide decisions, including those
19 of its subsidiaries, related to marketing, advertising, GHG emissions and climate change resulting
20 from the company’s fossil fuel products, and communications strategies concerning climate
21 change and the link between fossil fuel use and climate-related impacts on the environment and
22 humans. Overall accountability for climate change within the Shell Group lies with Shell plc’s
23 Chief Executive Officer and Executive Committee. For instance, at least as early as 1988, Shell
24 plc, through its predecessors and subsidiaries, was researching company-wide CO₂ emissions and
25 concluded that the Shell Group accounted for 4% of the CO₂ emitted worldwide from
26 combustion, and that climatic changes could compel the Shell Group, as controlled by Shell plc,
27 to examine the possibilities of expanding and contracting its business accordingly.
28

1 d. Defendant Shell USA, Inc. (formerly Shell Oil Company) is a wholly owned
2 subsidiary of Shell plc that acts on Shell plc's behalf and is subject to Shell plc's control. Shell
3 USA, Inc. is incorporated in Delaware, with its principal place of business in Houston, Texas.
4 Shell USA, Inc. has been registered to do business in California since 1949. Shell USA, Inc. was
5 formerly known as, did or does business as, and/or is the successor in liability to Shell Oil
6 Company; Shell Oil; Deer Park Refining LP; Shell Oil Products US; Shell Chemical LP; Shell
7 Trading (US) Company; Shell Energy Resources Company; Shell Energy Services Company,
8 L.L.C.; The Pennzoil Company; and Pennzoil-Quaker State Company.

9 e. Defendant Shell Oil Products Company LLC is a wholly owned subsidiary of
10 Shell USA, Inc., that acts on Shell USA, Inc.'s behalf and is subject to Shell USA, Inc.'s control.
11 Shell Oil Products Company LLC is incorporated in Delaware, with its principal place of business
12 in Houston, Texas, and has been registered to do business in California since 2001. Shell Oil
13 Products Company LLC was formerly known as, did or does business as, and/or is the successor
14 in liability to Shell Oil Products Company, which was a Delaware corporation that converted to a
15 limited liability company in 2001.

16 f. Defendants Shell plc, Shell USA, Inc., Shell Oil Products Company LLC, and
17 their predecessors, successors, parents, subsidiaries, affiliates, and divisions are collectively
18 referred to herein as "Shell."

19 g. The State's claims against Shell arise out of and are related to the acts and
20 omissions of Shell in California and elsewhere that caused and will cause injuries in California.

21 h. Shell has purposefully directed its tortious conduct toward California by
22 distributing, marketing, advertising, promoting, and supplying its fossil fuel products in
23 California, with knowledge that the intended use of those products for combustion has caused and
24 will continue to cause climate change-related harms in California, including the State's injuries.
25 Shell's statements in California and elsewhere made in furtherance of its campaign of deception
26 about and denial of climate change, and Shell's affirmative promotion of its fossil fuel products
27 as safe with knowledge of how the intended use of those products would cause climate change-
28 related harms, were designed to conceal these harms and mislead consumers and the public,

1 including the State and its residents, about the serious adverse consequences that would result
2 from continued use of Shell's products. That conduct was purposefully directed to reach and
3 influence the State and its residents, to continue unabated use of Shell's fossil fuel products in
4 California, thereby resulting in the State's injuries.

5 i. Over the last several decades and continuing to the present day, Shell spent
6 millions of dollars on radio, television, online, social media, and outdoor advertisements in the
7 California market related to its fossil fuel products. Since at least 1970, and continuing to the
8 present day, Shell has advertised its fossil fuel products in print publications circulated widely to
9 California consumers, including but not limited to the following: *The Atlantic*, *The Economist*,
10 *Life*, *National Geographic*, *Newsweek*, *The New York Times*, *Sports Illustrated*, *Time Magazine*,
11 *The Wall Street Journal*, and *The Washington Post*. Shell has also run advertisements in
12 California media outlets, including but not limited to the following: NBC 11 Bay Area, *The San*
13 *Bernardino Sun*, *The Santa Rosa Press Democrat*, and *Whittier Daily News*. As further detailed
14 herein, these include advertisements containing false or misleading statements,
15 misrepresentations, and/or material omissions obfuscating the connection between the production
16 and use of Shell's fossil fuel products and climate change, and/or misrepresenting Shell's
17 products or Shell itself as environmentally friendly.

18 j. Significant quantities of Shell's fossil fuel products are or have been
19 transported, traded, distributed, promoted, marketed, manufactured, sold, and/or consumed in
20 California, from which activities Shell derives and has derived substantial revenue. Shell
21 conducts and controls, either directly or through franchise agreements, retail fossil fuel sales at
22 gas station locations throughout California, at which locations it promotes, advertises, and sells its
23 fossil fuel products under its Shell brand name. Shell operates over 1,000 Shell-branded
24 petroleum service stations in California. During the period relevant to this Complaint, Shell sold a
25 substantial percentage of all retail gasoline sold in California. Shell also supplies, markets, and
26 promotes its Pennzoil line of lubricants at retail and service stations throughout California. From
27 1924 to 1992, Shell owned and operated an oil refinery in Carson, California, where it now owns
28 and operates the property as a distribution facility for petroleum and petroleum products

1 throughout Southern California. From 1915 to 2020, Shell owned and operated an oil refinery in
2 Martinez, California. From 1998-2007, Shell owned and operated an oil refinery in Wilmington,
3 California. From 1998 to 2005, Shell owned and operated an oil refinery in Bakersfield,
4 California.

5 k. Shell historically directed its fossil fuel product advertising, marketing, and
6 promotional campaigns to California, including through maps that identified the locations of its
7 service stations in California. Shell markets and advertises its fossil fuel products in California to
8 California residents by maintaining an interactive website available to prospective customers by
9 which it directs California residents to Shell's nearby retail service stations. Shell offers a
10 proprietary credit card known as the "Shell Fuel Rewards Card," which allows consumers in
11 California to pay for gasoline and other products at Shell-branded service stations, and which
12 encourages consumers to use Shell-branded gas stations by offering various rewards, including
13 discounts on gasoline purchases. Shell further maintains a smartphone application known as the
14 "Shell US App" that offers California consumers a cashless payment method for gasoline and
15 other products at Shell-branded service stations. California consumers utilize the payment method
16 by providing their credit card information through the application. California consumers can also
17 receive rewards, including discounts on gasoline purchases, by registering their personal
18 identifying information in the Shell US App and using the application to identify and activate gas
19 pumps at Shell service stations during a purchase.

20 14. **Chevron Entities: Chevron Corporation; Chevron U.S.A. Inc.**

21 a. Defendant Chevron Corporation is a multinational, vertically integrated energy
22 and chemicals company incorporated in Delaware, with its global headquarters and principal
23 place of business in San Ramon, California. Chevron Corporation, through its predecessor
24 Standard Oil Company of California, has been registered to do business in California since 1926.
25 Chevron Corporation was formerly known as, did or does business as, and/or is the successor in
26 liability to Standard Oil Company of California (also known as "Socal"), Texaco Inc., and
27 ChevronTexaco Corporation.

28

1 b. Chevron Corporation operates through a web of United States and international
2 subsidiaries at all levels of the fossil fuel supply chain. Chevron Corporation and its subsidiaries’
3 operations include, but are not limited to: exploration, development, production, storage,
4 transportation, and marketing of crude oil and natural gas; refining crude oil into petroleum
5 products and marketing those products; and manufacturing and marketing commodity
6 petrochemicals, plastics for industrial uses, and fuel and lubricant additives.

7 c. Chevron Corporation controls and has controlled company-wide decisions
8 about the quantity and extent of fossil fuel production and sales, including those of its
9 subsidiaries. Chevron Corporation determines whether and to what extent its corporate holdings
10 market, produce, and/or distribute fossil fuel products.

11 d. Chevron Corporation controls and has controlled company-wide decisions,
12 including those of its subsidiaries, related to marketing, advertising, GHG emissions and climate
13 change resulting from the company’s fossil fuel products, and communications strategies
14 concerning climate change and the link between fossil fuel use and climate-related impacts on the
15 environment and humans. Overall accountability for climate change within Chevron Corporation
16 lies with Chevron Corporation’s Board of Directors and Executive Committee.

17 e. Defendant Chevron U.S.A. Inc. is a wholly owned subsidiary of Chevron
18 Corporation that acts on Chevron Corporation’s behalf and is subject to Chevron Corporation’s
19 control. Chevron U.S.A. Inc. is a Pennsylvania corporation, with its principal place of business in
20 San Ramon, California. Through its predecessors, Chevron U.S.A. Inc. has been registered to do
21 business in California since 1965. Chevron U.S.A. Inc. was formerly known as, did or does
22 business as, and/or is the successor in liability to Gulf Oil Corporation, Gulf Oil Corporation of
23 Pennsylvania, Chevron Products Company, and Chevron Chemical Company, and Chevron
24 Chemical Company LLC.

25 f. Defendants Chevron Corporation and Chevron U.S.A. Inc., together with their
26 predecessors, successors, parents, subsidiaries, affiliates, and divisions, are collectively referred
27 to herein as “Chevron.”
28

1 g. The State’s claims against Chevron arise out of and are related to the acts and
2 omissions of Chevron in California and elsewhere that caused and will cause injuries in
3 California.

4 h. Chevron has purposefully directed its tortious conduct toward California by
5 distributing, marketing, advertising, promoting, and supplying its fossil fuel products in
6 California, with knowledge that the intended use of those products for combustion has caused and
7 will continue to cause climate change-related harms in California, including the State’s injuries.
8 Chevron’s statements in California and elsewhere made in furtherance of its campaign of
9 deception about and denial of climate change, and Chevron’s affirmative promotion of its fossil
10 fuel products as safe with knowledge of how the intended use of those products would cause
11 climate change-related harms, were designed to conceal and mislead consumers and the public,
12 including the State and its residents, about the serious adverse consequences that would result
13 from continued use of Chevron’s products. That conduct was purposefully directed to reach and
14 influence the State and its residents to continue unabated use of Chevron’s fossil fuel products in
15 California, thereby resulting in the State’s injuries.

16 i. Over the last several decades and continuing to the present day, Chevron spent
17 millions of dollars on radio, television, online, social media, and outdoor advertisements in the
18 California market related to its fossil fuel products. Since at least 1970, and continuing to the
19 present day, Chevron has advertised in print publications circulated widely to California
20 consumers, including but not limited to the following: *The Atlantic*, *Life*, *National Geographic*,
21 *The New York Times*, *Sports Illustrated*, *Time Magazine*, *The Wall Street Journal*, and *The*
22 *Washington Post*. Chevron has also run advertisements in California media outlets, including but
23 not limited to the following: CBS 5 San Francisco, *East Bay Times*, *Los Angeles Times*, *San*
24 *Francisco Business Times*, *San Francisco Examiner*, and *The Mercury News*. As further detailed
25 herein, these include advertisements containing false or misleading statements,
26 misrepresentations, and/or material omissions obfuscating the connection between the production
27 and use of Chevron’s fossil fuel products and climate change, and/or misrepresenting Chevron’s
28 products or Chevron itself as environmentally friendly.

1 j. Significant quantities of Chevron’s fossil fuel products are or have been
2 transported, traded, distributed, promoted, marketed, manufactured, sold, and/or consumed in
3 California, from which activities Chevron derives and has derived substantial revenue. Chevron
4 conducts and controls, either directly or through franchise agreements, retail fossil fuel sales at
5 gas station locations throughout California, at which locations it promotes, advertises, and sells its
6 fossil fuel products under its various brand names, including Chevron, Texaco, and other brand
7 names. Chevron operates over 1,500 Chevron-branded petroleum service stations in California.
8 Chevron has owned and operated an oil refinery in Richmond, California, since 1902, and has
9 owned and operated an oil refinery in El Segundo, California, since 1911. During the period
10 relevant to this Complaint, Chevron sold a substantial percentage of all retail gasoline sold in
11 California.

12 k. Chevron historically directed its fossil fuel product advertising, marketing, and
13 promotional campaigns to California, including through maps that identified the locations of its
14 service stations in California. Chevron markets and advertises its fossil fuel products in California
15 to California residents by maintaining an interactive website available to prospective customers
16 by which it directs California residents to Chevron’s nearby retail service stations. Chevron
17 markets and sells engine lubricants and motor oils to California customers under its Delo,
18 IsoClean, Techron, and Havoline brand names at retail outlets. Chevron offers a proprietary credit
19 card known as the “Chevron Techron Advantage Credit Card,” which allows consumers in
20 California to pay for gasoline and other products at Chevron-branded service stations, and which
21 encouraged California consumers to use Chevron-branded service stations by offering various
22 rewards, including discounts on gasoline purchases at Chevron service stations and cash rebates.
23 Chevron further maintains two smartphone applications known as the “Chevron App” and the
24 “Texaco App,” both part of the “Chevron Texaco Rewards” program. The program offers
25 California consumers a cashless payment method for gasoline and other products at Chevron- and
26 Texaco-branded service stations. California consumers utilize the payment method by providing
27 their credit card information through the application. California consumers can also receive
28 rewards, including discounts on gasoline purchases, by registering their personal identifying

1 information in the apps and by using the applications to identify and activate gas pumps at
2 Chevron and Texaco service stations during a purchase.

3 15. **ConocoPhillips Entities: ConocoPhillips, ConocoPhillips Company, Phillips 66,**
4 **Phillips 66 Company**

5 a. Defendant ConocoPhillips is a multinational energy company incorporated in
6 Delaware, with its principal place of business in Houston, Texas. ConocoPhillips consists of
7 numerous divisions, subsidiaries, and affiliates that execute ConocoPhillips’s fundamental
8 decisions related to all aspects of fossil fuel production, including exploration, extraction,
9 production, manufacture, transport, and marketing.

10 b. ConocoPhillips controls and has controlled company-wide decisions about the
11 quantity and extent of fossil fuel production and sales, including those of its subsidiaries.
12 ConocoPhillips determines whether and to what extent its corporate holdings market, produce,
13 and/or distribute fossil fuel products. ConocoPhillips’s most recent annual report to the Securities
14 and Exchange Commission subsumes the operations of ConocoPhillips’s subsidiaries. In
15 ConocoPhillips’s Form 10-K filed with the Securities and Exchange Commission for Fiscal Year
16 2022, the company represents that its value—for which ConocoPhillips maintains ultimate
17 responsibility—is a function of its decisions to direct subsidiaries to develop crude oil, bitumen,
18 natural gas, and natural gas liquids from ConocoPhillips’s reserves into fossil fuel products and to
19 explore for and replace those reserves with more fossil fuels: “Unless we successfully develop
20 resources, the scope of our business will decline, resulting in an adverse impact to our
21 business. . . . If we are not successful in replacing the resources we produce with good prospects
22 for future organic development or through acquisitions, our business will decline.”
23 ConocoPhillips optimizes the ConocoPhillips group’s oil and gas portfolio to fit ConocoPhillips’s
24 strategic plan. For example, in November 2016, ConocoPhillips announced a plan to generate \$5
25 billion to \$8 billion of proceeds over two years by optimizing its business portfolio, including its
26 fossil fuel product business, to focus on low cost-of-supply fossil fuel production projects that
27 strategically fit its development plans.
28

1 c. ConocoPhillips controls and has controlled company-wide decisions, including
2 those of its subsidiaries, related to marketing, advertising, GHG emissions and climate change
3 resulting from the company's fossil fuel products, and communications strategies concerning
4 climate change and the link between fossil fuel use and climate-related impacts on the
5 environment and humans. For instance, ConocoPhillips's Board of Directors has the highest level
6 of direct responsibility for climate change policy within the company. ConocoPhillips has
7 developed and purportedly implements a corporate Climate Change Action Plan to govern
8 climate change decision-making across all entities in the ConocoPhillips group.

9 d. Defendant ConocoPhillips Company is a wholly owned subsidiary of
10 ConocoPhillips that acts on ConocoPhillips's behalf and is subject to ConocoPhillips's control.
11 ConocoPhillips Company is incorporated in Delaware, with its principal place of business in
12 Houston, Texas, and has been registered to do business in California since 1947. ConocoPhillips
13 Company was formerly known as, did or does business as, and/or is the successor in liability to
14 Phillips Petroleum Company.

15 e. Defendant Phillips 66 is a multinational energy and petrochemical company
16 incorporated in Delaware, with its principal place of business in Houston, Texas. It encompasses
17 downstream fossil fuel processing, refining, transport, and marketing segments that were formerly
18 owned and/or controlled by ConocoPhillips.

19 f. Defendant Phillips 66 Company is a wholly owned subsidiary of Phillips 66
20 that acts on Phillips 66's behalf and is subject to Phillips 66's control. Phillips 66 Company is
21 incorporated in Delaware, with its principal place of business in Houston, Texas, and has been
22 registered to do business in California since 2011. Phillips 66 Company had been registered since
23 1964 under a different name, Phillips Chemical Company, which was a wholly owned subsidiary
24 of the Phillips Petroleum Company. Phillips Chemical Company changed its name to Phillips 66
25 Company in 1985, and that iteration of Phillips 66 Company was terminated in 1991. Phillips 66
26 Company was formerly known as, did or does business as, and/or is the successor in liability to
27 Phillips Petroleum Company; Phillips Chemical Company; Conoco, Inc.; Tosco Corporation; and
28 Tosco Refining Co.

1 g. Defendants ConocoPhillips, ConocoPhillips Company, Phillips 66, and Phillips
2 66 Company, as well as their predecessors, successors, parents, subsidiaries, affiliates, and
3 divisions, are collectively referred to herein as “ConocoPhillips.”

4 h. The State’s claims against ConocoPhillips arise out of and are related to the acts
5 and omissions of ConocoPhillips in California and elsewhere that caused and will cause injuries
6 in California.

7 i. ConocoPhillips has purposefully directed its tortious conduct toward California
8 by distributing, marketing, advertising, promoting, and supplying its fossil fuel products in
9 California, with knowledge that the intended use of those products for combustion has caused and
10 will continue to cause climate change-related harms in California, including the State’s injuries.
11 ConocoPhillips’s statements in California and elsewhere made in furtherance of its campaign of
12 deception about and denial of climate change, and ConocoPhillips’s affirmative promotion of its
13 fossil fuel products as safe with knowledge of how the intended use of those products would
14 cause climate change-related harms, were designed to conceal and mislead consumers and the
15 public, including the State and its residents, about the serious adverse consequences that would
16 result from continued use of ConocoPhillips’s products. That conduct was purposefully directed
17 to reach and influence the State and its residents to continue unabated use of ConocoPhillips’s
18 fossil fuel products in California, thereby resulting in the State’s injuries.

19 j. Over the last several decades and continuing to the present day, ConocoPhillips
20 spent millions of dollars on radio, television, online, social media, and outdoor advertisements in
21 the California market related to its fossil fuel products. Since at least 1970, and continuing to the
22 present day, ConocoPhillips has advertised in print publications circulated widely to California
23 consumers, including but not limited to the following: *The Atlantic*, *Life*, *National Geographic*,
24 *Newsweek*, *The New York Times*, *People*, *Sports Illustrated*, *Time Magazine*, *The Wall Street*
25 *Journal*, and *The Washington Post*. As further detailed herein, these include advertisements
26 containing false or misleading statements, misrepresentations, and/or material omissions
27 obfuscating the connection between the production and use of ConocoPhillips’s fossil fuel
28

1 products and climate change, and/or misrepresenting ConocoPhillips's products or
2 ConocoPhillips itself as environmentally friendly.

3 k. Significant quantities of ConocoPhillips's fossil fuel products are or have been
4 transported, traded, distributed, promoted, marketed, manufactured, sold, and/or consumed in
5 California, from which activities ConocoPhillips derives and has derived substantial revenue.
6 ConocoPhillips conducts and controls, either directly or through franchise agreements, retail
7 fossil fuel sales at gas station locations throughout California, at which locations it promotes,
8 advertises, and sells its fossil fuel products under its various brand names, including Conoco,
9 Phillips 66, and 76. ConocoPhillips also markets and sells to California customers at retail outlets
10 engine lubricants and motor oils under its Phillips 66, Kendall, and Red Line brand names.
11 ConocoPhillips operates hundreds of 76-branded petroleum service stations throughout
12 California. During the period relevant to this Complaint, ConocoPhillips sold a substantial
13 percentage of all retail gasoline sold in California.

14 l. ConocoPhillips does substantial fossil fuel product-related business in
15 California, and a substantial quantity of its fossil fuel products are extracted, refined, transported,
16 traded, distributed, marketed, and/or sold in California. For instance, ConocoPhillips owns and/or
17 operates oil and natural gas terminals in Richmond and Los Angeles, California; owns and
18 operates oil refineries in Arroyo Grande, Colton, and Wilmington, California; and distributes
19 ConocoPhillips fossil fuel products throughout California. Phillips 66 also owns and operates oil
20 refineries in Rodeo, Santa Maria, and Los Angeles, California. All of these refineries were owned
21 and operated by ConocoPhillips and its predecessors-in-interest from 1997 to 2012.

22 m. ConocoPhillips has historically directed its fossil fuel product advertising,
23 marketing, and promotional campaigns to California, including through maps identifying its
24 services throughout California. ConocoPhillips markets and advertises its fossil fuel products in
25 California to California residents by maintaining an interactive website available to prospective
26 customers by which it directs California residents to ConocoPhillips's nearby retail service
27 stations. ConocoPhillips offers a proprietary credit card known as the "76 Credit Card," which
28 allows consumers in California to pay for gasoline and other products at 76-branded service

1 stations, and which encourages California consumers to use 76-branded service stations by
2 offering various rewards, including discounts on gasoline purchases at 76-branded service
3 stations and cash rebates. ConocoPhillips further maintains a nationwide smartphone application
4 known as the “Fuel Forward App.” The application offers California consumers a cashless
5 payment method for gasoline and other products at 76-branded service stations. California
6 consumers utilize the payment method by providing their credit card information through the
7 application. California consumers can also apply for a 76 Credit Card through the application. By
8 registering their personal identifying information in the application and by using the application
9 to identify and activate gas pumps at 76-branded service stations, California consumers can
10 receive additional rewards, such as further discounts on ConocoPhillips gasoline purchases.

11 **16. BP Entities: BP p.l.c., BP America Inc.**

12 a. Defendant BP p.l.c. is a multinational, vertically integrated energy and
13 petrochemical public limited company registered in England and Wales, with its principal place
14 of business in London, England. BP p.l.c. consists of three main operating segments: (1)
15 exploration and production, (2) refining and marketing, and (3) gas power and renewables. BP
16 p.l.c. is the ultimate parent company of numerous subsidiaries, including Atlantic Richfield
17 Company, referred to collectively herein as the “BP Group,” which explore for and extract oil and
18 gas worldwide; refine oil into fossil fuel products such as gasoline; and market and sell oil, fuel,
19 other refined petroleum products, and natural gas worldwide. BP p.l.c.’s subsidiaries explore for
20 oil and natural gas under a wide range of licensing and other contractual agreements. BP p.l.c.
21 was formerly known as, did or does business as, and/or is the successor in liability to British
22 Petroleum Company, British Petroleum Company p.l.c., BP Amoco p.l.c., Amoco Corporation,
23 and Atlantic Richfield Company.

24 b. BP p.l.c. controls and has controlled company-wide decisions about the
25 quantity and extent of fossil fuel production and sales, including those of its subsidiaries. BP p.l.c.
26 is the ultimate decision-maker with respect to fundamental decisions about the BP Group’s core
27 business, e.g., the level of fossil fuel production companywide, including production among BP
28 p.l.c.’s subsidiaries. For instance, BP p.l.c. reported that in 2016-17, it brought online 13 major

1 exploration and production projects. These contributed to a 12% increase in the BP Group's
2 overall fossil fuel product production. These projects were carried out by BP p.l.c.'s subsidiaries.
3 Based on these projects, BP p.l.c. noted that it expected the BP Group to deliver to customers
4 900,000 barrels of new product per day by 2021. BP p.l.c. further reported that in 2017 it
5 sanctioned three new exploration projects in Trinidad, India, and the Gulf of Mexico.

6 c. BP p.l.c. controls and has controlled company-wide decisions, including those
7 of its subsidiaries, related to marketing, advertising, GHG emissions and climate change resulting
8 from the company's fossil fuel products, and communications strategies concerning climate
9 change and the link between fossil fuel use and climate-related impacts on the environment and
10 humans. BP p.l.c. makes fossil fuel production decisions for the entire BP Group based on factors
11 including climate change. BP p.l.c.'s Board of Directors is the highest decision-making body
12 within the company, with direct responsibility for the BP Group's climate change policy. BP
13 p.l.c.'s chief executive is responsible for maintaining the BP Group's system of internal control
14 that governs the BP Group's business conduct. BP p.l.c.'s senior leadership directly oversees a
15 "carbon steering group," which manages climate change-related matters and consists of two
16 committees—both overseen directly by the Board of Directors—that focus on climate change-
17 related investments.

18 d. Defendant BP America Inc. is a wholly owned subsidiary of BP p.l.c. that acts
19 on BP p.l.c.'s behalf and is subject to BP p.l.c.'s control. BP America Inc. is a vertically
20 integrated energy and petrochemical company incorporated in the State of Delaware, with its
21 headquarters and principal place of business in Houston, Texas, and has been registered to do
22 business in California since 2000. BP America Inc. consists of numerous divisions and affiliates
23 in all aspects of fossil fuel production, including exploration for and production of crude oil and
24 natural gas; manufacture of petroleum products; and transportation, marketing, and sale of crude
25 oil, natural gas, and petroleum products. BP America Inc. was formerly known as, did or does
26 business as, and/or is the successor in liability to Amoco Oil Company; Amoco Production
27 Company; ARCO Products Company; BP Exploration & Oil, Inc.; BP Products North America
28 Inc.; BP Amoco Corporation; BP Oil, Inc.; BP Oil Company; Sohio Oil Company; Standard Oil

1 of Ohio (SOHIO); Standard Oil (Indiana); and Atlantic Richfield Company (a Pennsylvania
2 Corporation) and its division, the Arco Chemical Company.

3 e. Defendants BP p.l.c. and BP America Inc., together with their predecessors,
4 successors, parents, subsidiaries, affiliates, and divisions, are collectively referred to herein as
5 “BP.”

6 f. The State’s claims against BP arise out of and are related to the acts and
7 omissions of BP in California and BP’s actions elsewhere that caused and will cause injuries in
8 California.

9 g. BP has purposefully directed its tortious conduct toward California by
10 distributing, marketing, advertising, promoting, and supplying its fossil fuel products in
11 California, with knowledge that the intended use of those products for combustion have caused
12 and will continue to cause climate change-related harms in California, including the State’s
13 injuries. BP’s statements in California and elsewhere made in furtherance of its campaign of
14 deception about and denial of climate change, and BP’s affirmative promotion of its fossil fuel
15 products as safe with knowledge of how the intended use of those products would cause climate
16 change-related harms, were designed to conceal and mislead consumers and the public, including
17 the State and its residents, about the serious adverse consequences that would result from
18 continued use of BP’s products. That conduct was purposefully directed to reach and influence
19 the State and its residents to continue unabated use of BP’s fossil fuel products in California,
20 thereby resulting in the State’s injuries.

21 h. Over the last several decades and continuing to the present day, BP—especially
22 BP p.l.c.—spent millions of dollars on radio, television, online, social media, and outdoor
23 advertisements in the California market related to its fossil fuel products. Since at least 1988 and
24 continuing to the present day, BP has advertised in print publications circulated widely to
25 California consumers, including but not limited to the following: *The Atlantic*, *Life*, *Newsweek*,
26 *The New York Times*, *Sports Illustrated*, *Time*, *The Wall Street Journal*, and *The Washington*
27 *Post*. BP has also run advertisements in California media outlets, including but not limited to the
28 following: ABC 7 San Francisco, *Inland Valley Daily Bulletin*, KBCW 44 San Francisco, *Los*

1 *Angeles Times, The Orange County Register, Pasadena Star News, Redlands Daily Facts, The*
2 *San Bernardino Sun, The Mercury News, SFGate.com, and Whittier Daily News.* As further
3 detailed herein, these include advertisements containing false or misleading statements,
4 misrepresentations, and/or material omissions obfuscating the connection between the production
5 and use of BP's fossil fuel products and climate change, and/or misrepresenting BP's products or
6 BP itself as environmentally friendly.

7 i. Significant quantities of BP's fossil fuel products are or have been transported,
8 traded, distributed, promoted, marketed, manufactured, sold, and/or consumed in California, from
9 which activities BP derives and has derived substantial revenue. BP conducts and controls, either
10 directly or through franchise agreements, retail fossil fuel sales at gas station locations in
11 substantial portions of California, at which locations it promotes, advertises, and sells its fossil
12 fuel products under its ARCO brand name. Among other operations, BP operates more than 300
13 ARCO-licensed and branded gas stations in California, and distributes and markets petroleum-
14 based lubricants marketed under the Castrol brand name throughout California. From 2000 to
15 2013, BP also owned and operated an oil refinery in Carson, California. During the period
16 relevant to this Complaint, BP sold a substantial percentage of all retail gasoline sold in
17 California. BP's marketing and trading business maintains an office in Irvine, California. BP
18 maintains an energy research center in San Diego, California.

19 j. BP historically directed its fossil fuel product advertising, marketing, and
20 promotional campaigns to California, including through maps that identified the locations of its
21 service stations in California. BP markets and advertises its fossil fuel products in California to
22 California residents by maintaining an interactive website available to prospective customers by
23 which it directs California residents to BP's nearby retail service stations and/or lubricant
24 distributors.

25 17. The Exxon, Shell, Chevron, ConocoPhillips, and BP entities set forth above are
26 collectively referred to as the "Fossil Fuel Defendants."
27
28

1 18. **American Petroleum Institute**

2 a. Defendant American Petroleum Institute (API) is a nonprofit corporation based
3 in the District of Columbia and registered to do business in California. API was created in 1919 to
4 represent the American oil and gas industry as a whole. With more than 600 members, API is the
5 country's largest oil trade association. API's purpose is to advance its members' collective
6 business interests, which includes increasing consumer consumption of oil and gas for the
7 financial profit of the Fossil Fuel Defendants and other oil and gas companies. Among other
8 functions, API also coordinates members of the petroleum industry, gathers information of
9 interest to the industry, and disseminates that information to its members.

10 b. Acting on behalf of and under the supervision and control of the Fossil Fuel
11 Defendants, API has, since at least 1988, participated in and led several coalitions, front groups,
12 and organizations that have promoted disinformation about the climate impacts of fossil fuel
13 products to consumers—including, but not limited to, the Global Climate Coalition, Partnership
14 for a Better Energy Future, Coalition for American Jobs, Alliance for Energy and Economic
15 Growth, and Alliance for Climate Strategies. These front groups were formed to promote climate
16 disinformation and advocacy from a purportedly objective source, when in fact these groups were
17 financed and controlled by the Fossil Fuel Defendants and other oil and gas companies. The
18 Fossil Fuel Defendants have benefited from the spread of this disinformation because, among
19 other things, it has ensured a thriving consumer market for oil and gas, resulting in substantial
20 profits for the Fossil Fuel Defendants.

21 c. API reports that in 2022 it made approximately \$239 million in total revenue,
22 including approximately \$110 million from membership dues.

23 d. API's stated mission includes "influenc[ing] public policy in support of a
24 strong, viable U.S. oil and natural gas industry," which includes increasing consumers'
25 consumption of oil and gas for the financial benefit of the Fossil Fuel Defendants and other oil
26 and gas companies. In effect, API acts and has acted as a marketing arm for its member
27 companies, including the Fossil Fuel Defendants. Over the last several decades, API has spent
28 millions of dollars on television, newspaper, radio, social media, and internet advertisements in

1 the California market. API has also run advertisements in California media outlets, including but
2 not limited to the following: ABC 7 San Francisco, *The Coast News*, *East Bay Times*, *Inland*
3 *Valley Daily Bulletin*, *The Orange County Register*, *Pasadena Star News*, *Press Telegram*,
4 *Redlands Daily Facts*, *The Mercury News*, *SFGate.com*, *Time Out Los Angeles*, and *Whittier*
5 *Daily News*.

6 e. Member companies participate in API strategy, governance, and operation
7 through their membership dues and by contributing company officers and other personnel to API
8 boards, committees, and task forces. The Fossil Fuel Defendants have collectively steered the
9 policies and trade practices of API through membership, Executive Committee roles, and/or
10 providing budgetary funding for API. The Fossil Fuel Defendants have used their control over
11 and involvement in API to develop and execute a long-term advertising and communications
12 campaign centered on climate change denialism. The goal of the campaign was to influence
13 consumer demand for the Fossil Fuel Defendants' fossil fuel products. The Fossil Fuel
14 Defendants directly controlled, supervised, and participated in API's misleading messaging
15 regarding climate change.

16 f. In addition to national promotional campaigns circulated in California, API has
17 also targeted California consumers directly by creating and disseminating misleading
18 advertisements that distinctly promote consumption of fossil fuel products in California. API has
19 run numerous press releases within California touting the direct and indirect benefits to California
20 of the oil and gas industries' operations in California and elsewhere in the United States. The
21 reports, sponsored by API, on which API bases its claims, do not mention climate change at all,
22 nor do the reports mention any of the direct and indirect harms to California caused by the
23 production, marketing, sale, and use of API members' fossil fuel products. Further, API's
24 Department of Production sponsors two local API chapters in California, the Coastal Chapter and
25 the San Joaquin Valley Chapter, which function "to promote a more cordial understanding by the
26 public of the close economic relationship that exists between the petroleum industry and other
27 lines of business." API also regularly hosts within California trade association events for oil and
28 gas and related industries.

1 g. All of the Fossil Fuel Defendants and/or their predecessors-in-interest have
2 been key API members at all times relevant to this Complaint. All of the Fossil Fuel Defendants
3 are currently members of API. Executives from Exxon, Shell, Chevron, ConocoPhillips, and BP
4 have served on the API Executive Committee and/or as API Chairman, essentially serving as
5 corporate officers. For example, Exxon's CEO served on API's Executive Committee for 15 of
6 the 25 years between 1991 and 2016 (1991, 1996-1997, 2001, 2005-2016). BP's CEO served as
7 API's Chairman in 1988, 1989, and 1998. Chevron's CEO served as API Chairman in 1994,
8 1995, 2003, and 2012. Shell's President served on API's Executive Committee from 2005 to
9 2006. ConocoPhillips Chairman and CEO Ryan Lance was API Board President from 2016 to
10 2018, and Exxon President and CEO Darren Woods was API Board President from 2018 to 2020.
11 In 2020, API elected Phillips 66 Chairman and CEO Greg Garland to serve a two-year term as its
12 Board President. Executives from ConocoPhillips also served as members of API's Board of
13 Directors at various times.

14 h. Relevant information was shared among API and the Fossil Fuel Defendants
15 and the Fossil Fuel Defendants' predecessors-in-interest through the following: (1) API's
16 distribution of information to its members, and/or (2) participation of the Fossil Fuel Defendants'
17 officers and other personnel, and those of the Fossil Fuel Defendants' predecessors-in-interest, on
18 API boards, committees, and task forces.

19 i. The State's claims against API arise out of and are related to the acts and
20 omissions of API in California and elsewhere that caused and will cause injuries in California.

21 19. The true names and capacities, whether individual, corporate, associate, or otherwise
22 of Defendants Does 1 through 100, inclusive, are unknown to Plaintiff, who therefore sues said
23 Defendants by such fictitious names pursuant to Code of Civil Procedure section 474. Plaintiff is
24 informed and believes, and on that basis alleges, that each of the fictitiously named Defendants is
25 responsible in some manner for the acts and occurrences herein alleged, and that the State's
26 harms were caused by such Defendants.

1 **C. Relevant Non-Parties: Defendants' Agents/Front Groups**

2 20. As detailed below, each Fossil Fuel Defendant had actual knowledge, or should have
3 known, that its fossil fuel products were hazardous in that the intended use of the fossil fuel
4 products for combustion would substantially contribute to climate change and result in harms to
5 the State. The Fossil Fuel Defendants obtained knowledge of the hazards of their products
6 independently and through their membership and involvement in trade associations such as API.

7 21. The Fossil Fuel Defendants and API employed, financed, and participated in several
8 industry-created front groups to serve their mission of flooding the markets with climate change
9 disinformation and denialism. These organizations, acting on behalf of and under the supervision
10 and control of the Fossil Fuel Defendants, assisted the deception campaign by implementing
11 public advertising and outreach campaigns to discredit climate science, funding scientists to cast
12 doubt upon climate science and upon the extent to which climate change is caused by human
13 activity. In sum, the Fossil Fuel Defendants, through their front groups, engaged in a significant
14 marketing campaign that misrepresented and concealed the dangers of their fossil fuel products
15 with the aim of protecting or enhancing sales of these products to consumers, including
16 consumers in California. Defendants actively supervised, facilitated, consented to, and/or directly
17 participated in the misleading messaging of these front groups, from which the Fossil Fuel
18 Defendants profited significantly, including in the form of increased sales in California.

19 22. **The Global Climate Coalition (GCC)** was an industry group formed to preserve and
20 expand consumer demand for fossil fuels by publicly casting doubt on climate science and
21 opposing GHG emission reduction initiatives. The GCC was founded in 1989 in reaction to the
22 first meeting of the Intergovernmental Panel on Climate Change (IPCC), the United Nations body
23 for assessing the science related to climate change, and to NASA scientist James Hansen's
24 presentation to the Senate Committee on Energy and Natural Resources, in which Hansen
25 emphasized that climate change was already happening and would lead to dire consequences if
26 left unaddressed. The GCC disbanded in or around 2001. Founding members included API, Shell
27 Oil Company (currently, Shell); Texaco, Inc. (currently, Chevron); Amoco (currently, BP);
28

1 ARCO (owned by BP at the time); and Phillips Petroleum Company (currently, ConocoPhillips).
2 Tom Lambrix, director of government relations for Phillips Petroleum, was chairman of the GCC.

3 **III. JURISDICTION AND VENUE**

4 23. This Court has original jurisdiction over this action pursuant to article VI, section 10,
5 of the California Constitution.

6 24. This Court has personal jurisdiction over Defendants, pursuant to Code of Civil
7 Procedure section 410.10, because each Defendant purposefully availed itself of the California
8 market, and thus of the benefits of the laws of the State, during all times relevant to this
9 Complaint, so as to render California courts' exercise of jurisdiction over each Defendant
10 consistent with traditional notions of fair play and substantial justice. Each Fossil Fuel Defendant
11 researched, developed, manufactured, designed, marketed, distributed, released, promoted, and/or
12 otherwise sold its fossil fuel products in markets around the United States, including within
13 California.

14 25. Additionally, jurisdiction is proper over each non-resident Defendant for the
15 following reasons:

16 a. With respect to its subsidiaries, each non-resident Fossil Fuel Defendant parent
17 controls and has controlled decisions about the quantity and extent of its fossil fuel production
18 and sales; determines whether and to what extent to market, produce, and/or distribute its fossil
19 fuel products; and controls and has controlled decisions related to its marketing and advertising,
20 specifically communications strategies concerning climate change and the link between fossil fuel
21 use and impacts on the environment. Each non-resident Fossil Fuel Defendant parent has the
22 power to direct and control its non-resident subsidiaries named here. Thus, each subsidiary is the
23 agent of its parent. As agents, the subsidiaries of each non-resident Fossil Fuel Defendant
24 conducted activities in California at the direction and for the benefit of its parent company.
25 Specifically, the subsidiaries furthered each parent company's campaign of deception and denial
26 through misrepresentations, omissions, and affirmative promotion of the company's fossil fuel
27 products as safe with knowledge of the climate change-related harms that would result from the
28 intended use of those products, all of which resulted in climate change-related injuries in the State

1 and increased sales to the parent company. Therefore, the subsidiaries' jurisdictional activities are
2 properly attributed to each parent company and serve as a basis to assert jurisdiction over each of
3 the non-resident Fossil Fuel Defendant parent companies.

4 b. Through their various agreements with dealers, franchises, or otherwise, the
5 Fossil Fuel Defendants direct and control the branding, marketing, sales, promotions, image
6 development, signage, and advertising of their branded fossil fuel products at their respectively
7 branded gas stations in California, including point-of-sale advertising and marketing. The Fossil
8 Fuel Defendants dictate which grades and formulations of their gasoline may be sold at their
9 respectively branded stations.

10 c. The Fossil Fuel Defendants, by and through API and other organizations like
11 the GCC, conspired to conceal and misrepresent the known dangers of burning fossil fuels, to
12 knowingly withhold material information regarding the consequences of using fossil fuel
13 products, to spread knowingly false and misleading information to the public regarding the
14 weight of climate science research, and to engage in massive campaigns to promote continued
15 and increased use of their fossil fuel products, which they knew would result in injuries to the
16 State. Through their own actions and through their membership and participation in climate
17 denialist front groups, API and each Fossil Fuel Defendant were and are members of this
18 conspiracy. Defendants committed substantial acts to further the conspiracy in California by
19 making affirmative misrepresentations to California consumers, as well as misleading them by
20 omission, about the existence, causes, and effects of global warming; and by affirmatively
21 promoting the Fossil Fuel Defendants' fossil fuel products as safe, with knowledge of the
22 disastrous impacts that would result from the intended use of those products. A substantial effect
23 of this conspiracy has also and will also occur in California, as the State has suffered and will
24 suffer injuries from Defendants' wrongful conduct, including but not limited to the following:
25 extreme heat, severe droughts, water shortages, catastrophic wildfires, public health injuries,
26 massive storms, flooding, damage to agriculture, sea level rise, coastal erosion, damage to
27 ecosystems and habitat, biodiversity disruption, and other social and economic consequences of
28 these environmental changes. Defendants knew or should have known—based on information

1 provided to them from their internal research divisions, affiliates, trade associations, and industry
2 groups—that their actions in California and elsewhere would result in these injuries in and to the
3 State. Finally, the climate effects described herein are direct and foreseeable results of
4 Defendants’ conduct in furtherance of the conspiracy.

5 26. Venue is proper in this Court pursuant to Code of Civil Procedure section 393,
6 subdivision (a), because the violations of law and the public nuisance alleged in this Complaint
7 occurred in San Francisco County and throughout California.

8 **IV. FACTUAL BACKGROUND**

9 **A. Defendants Are Substantially Responsible for Causing and Accelerating** 10 **Climate Change**

11 27. The earth’s atmosphere is warming, sea level is rising, snow and ice cover is
12 diminishing, oceans are warming and acidifying, and hydrologic systems have been altered,
13 among other rapidly accelerating changes to our climate. These changes are directly harming
14 people’s health, lives, lifestyles, and livelihoods. According to the IPCC, the evidence that
15 humans are causing this warming of the Earth is unequivocal.³

16 28. Greenhouse gas emissions caused by human activities are the most significant driver
17 of climate change and ocean acidification.⁴ Over the past couple of decades, those emission rates
18 have accelerated, exceeding those predicted under previous “worst case” global emissions
19 scenarios. The severity of the continuing impacts of climate change on California will depend on
20 the success of mitigation and adaptation efforts in California and on the reduction of fossil fuel
21 consumption.⁵

22 29. Greenhouse gases are largely byproducts of human combustion of fossil fuels to
23 produce energy and use of fossil fuels to create petrochemical products. While there are several

Assessment* (2018) pp. 8-13, 20, 70, available at <https://www.climateassessment.ca.gov/state/> (as
of June 5, 2024).

1 greenhouse gases contributing to climate change, CO₂ is the primary greenhouse gas emitted as a
2 result of human activities.

3 30. Prior to World War II, most anthropogenic CO₂ emissions were caused by land-use
4 practices, such as forestry and agriculture, which altered the ability of the land and global
5 biosphere to absorb CO₂ from the atmosphere. The impacts of such activities on Earth's climate
6 were relatively minor. Since that time, however, both the annual rate and total volume of
7 anthropogenic CO₂ emissions have increased enormously following the dramatic rise of the
8 combustion of oil, gas, and coal, in particular in transportation and the stationary energy market.

9 31. The graph below illustrates that fossil fuel emissions are the dominant source of
10 increases in atmospheric CO₂ since the mid-twentieth century:

21 **Figure 1: Annual Global Emissions, 1850–2020⁶**

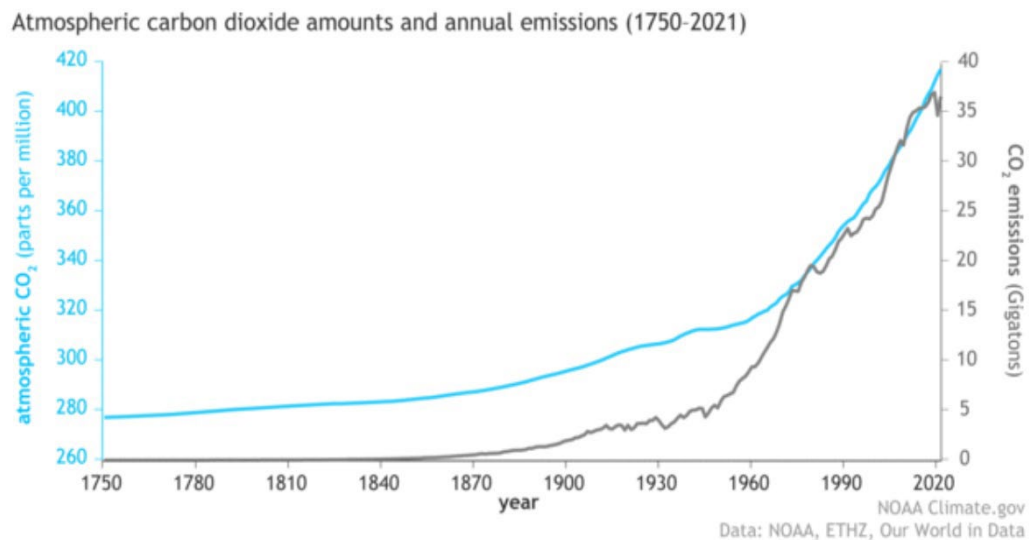

22 32. This acceleration of fossil fuel emissions has led to a correspondingly sharp rise in
23 atmospheric concentration of CO₂. Since 1960, the concentration of CO₂ in the atmosphere has
24 spiked from under 320 parts per million (ppm) to approximately 423 ppm.⁷ The concentration of

28 Record, available at <https://gml.noaa.gov/ccgg/trends/mlo.html> (as of June 5, 2024).

1 atmospheric CO₂ has also been accelerating. From 1960 to 1970, atmospheric CO₂ increased by
2 an average of approximately 0.9 ppm per year; over the last five years, it has increased by
3 approximately 2.4 ppm per year.⁸

4 33. Figure 2 indicates the tight nexus between the sharp increase in emissions from the
5 combustion of fossil fuels and the steep rise of atmospheric concentrations of CO₂.

15 **Figure 2: Atmospheric CO₂ Concentration and Annual Emissions⁹**

16 34. Because of the increased burning of fossil fuel products, concentrations of greenhouse
17 gases in the atmosphere are now at an unprecedented level, one not seen in at least three million
18 years.¹⁰

19 35. As greenhouse gases accumulate in the atmosphere, the Earth radiates less energy
20 back to space. This accumulation and associated disruption of the Earth's energy balance have
21 myriad environmental and physical consequences, including, but not limited to, the following:

22 a. Warming of the Earth's average surface temperature, both locally and globally,
23 and increased frequency and intensity of heat waves. To date, global average surface temperatures

1 have risen approximately 1.09°C (1.96°F) above preindustrial temperatures; temperatures in
2 particular locations have risen more.

3 b. Changes to the global climate generally, bringing about longer droughts and dry
4 periods interspersed with fewer and more severe periods of precipitation, and associated impacts
5 to the quantity and quality of water resources available to both human and ecological systems.

6 c. Increased frequency and intensity of extreme weather events due to increases in
7 evaporation, evapotranspiration, and precipitation, a consequence of the warming atmosphere's
8 increased ability to hold moisture.

9 d. Adverse impacts on human health associated with extreme weather, extreme
10 heat, worsening air quality, and vector-borne illnesses.

11 e. Flooding and inundation of land and infrastructure, increased erosion, higher
12 wave run-up and tides, increased frequency and severity of storm surges, saltwater intrusion, and
13 other impacts of higher sea levels.

14 f. Sea level rise, due to the thermal expansion of warming ocean waters and
15 runoff from melting glaciers and ice sheets.

16 g. Ocean acidification, primarily due to the increased uptake of atmospheric
17 carbon dioxide by the oceans.

18 h. Changes to terrestrial and marine ecosystems, and consequent impacts on the
19 populations and ranges of flora and fauna.

20 36. As discussed below, these consequences of Defendants' tortious and deceptive
21 conduct and its exacerbation of the climate crisis are already impacting California, its
22 communities, its people's health, and its natural resources, and these impacts will continue to
23 increase in severity. Absent Defendants' tortious and deceptive conduct and resultant
24 contributions to global warming, these harmful effects would have been far less extreme than
25 those currently occurring. Similarly, future harmful effects would also have been far less
26 detrimental—or would have been avoided entirely.¹¹

27 ¹¹ See, e.g., Clark et al., *Consequences of Twenty-First-Century Policy for Multi-*
28 *Millennial Climate and Sea-Level Change* (2016) 6 Nature Climate Change 360, 365 (“Our

1 37. From at least 1965 until the present, Defendants unduly inflated the market for fossil
2 fuel products by aggressively promoting the use of these products while knowing their associated
3 dangers, and by misrepresenting and concealing the hazards of those products to deceive
4 consumers and the public about the consequences of everyday use of fossil fuel products.

5 Consequently, substantially more anthropogenic greenhouse gases have been emitted into the
6 environment than would have been emitted absent Defendants' tortious and deceptive conduct.

7 38. By quantifying GHG pollution attributable to the Fossil Fuel Defendants' products
8 and conduct, climatic and environmental responses to those emissions are also calculable and can
9 be attributed to the Fossil Fuel Defendants both on an individual and an aggregate basis.¹²

10 39. Defendants' tortious, deceptive, and unconscionable conduct, as alleged herein,
11 caused a substantial portion of the global atmospheric GHG concentrations, and the past,
12 ongoing, and future disruptions to the environment—and consequent injuries to California, its
13 communities, and its resources—associated therewith.

14 40. Defendants, individually and collectively, have substantially and measurably
15 contributed to California's climate crisis-related injuries.

16 **B. Defendants Went to Great Lengths to Understand the Dangers Associated**
17 **with Fossil Fuel Products, and Either Knew or Should Have Known of**
18 **Those Dangers**

19 41. Defendants have known about the potential warming effects of GHG emissions since
20 as early as the 1950s, and they developed a sophisticated understanding of climate change that far
21 exceeded the knowledge of the general public. Although it was concealed at the time, the
22 industry's knowledge was uncovered in 2015 by journalists at *Inside Climate News* and the *Los*
Angeles Times, among others.¹³

23 modelling suggests that the human carbon footprint of about [470 billion tons] by 2000 . . . has
24 already committed Earth to a [global mean sea level] rise of ~1.7m (range of 1.2 to 2.2 m).”)

28 *on climate change research*, *L.A. Times* (Oct. 23, 2015), available at

1 42. In 1954, geochemist Harrison Brown and his colleagues at the California Institute of
2 Technology wrote to API, informing the trade association of their finding that fossil fuels had
3 caused atmospheric carbon dioxide levels to increase by about 5% since 1840.¹⁴ API continued to
4 fund the scientists for various research projects and measurements of carbon dioxide, but the
5 results were never published.¹⁵ In 1957, H.R. Brannon of Humble Oil Company (predecessor-in-
6 interest to Exxon) measured an increase in atmospheric carbon dioxide attributable to fossil fuels,
7 similar to—and in agreement with—that measured by Harrison Brown.¹⁶

8 43. In 1959, API organized an oil industry celebration in New York City.¹⁷ High-level oil
9 industry executives were in attendance, and one of the keynote speakers was the nuclear physicist
10 Edward Teller. Teller warned the industry that “a temperature rise corresponding to a 10[%]
11 increase in carbon dioxide will be sufficient to melt the icecap and submerge . . . [a]ll the coastal
12 cities.” Teller added that since “a considerable percentage of the human race lives in coastal
13 regions, I think that this chemical contamination is more serious than most people tend to
14 believe.”¹⁸ Following his speech, Teller was asked to “summarize briefly the danger from
15 increased carbon dioxide content in the atmosphere in this century.” He responded that “there is a
16 possibility the icecaps will start melting and the level of the oceans will begin to rise.”¹⁹

17 44. In 1965, the president of API, Frank Ikard, addressed leaders of the petroleum
18 industry at the trade association’s annual meeting. Ikard relayed the findings of a recent report to
19 industry leaders, saying, “[o]ne of the most important predictions of the report is that carbon

28 ¹⁸ Teller, *Energy Patterns of the Future*, in *Energy and Man: A Symposium* (1960) p. 58.

¹⁹ *Id.* at p. 70.

1 dioxide is being added to the earth's atmosphere by the burning of coal, oil, and natural gas at
2 such a rate that by the year 2000 the heat balance will be so modified as possibly to cause marked
3 changes in climate beyond local or even national efforts," and quoting the report's finding that
4 "the pollution from internal combustion engines is so serious, and is growing so fast, that an
5 alternative nonpolluting means of powering automobiles, buses, and trucks is likely to become a
6 national necessity."²⁰

7 45. Thus, by 1965, Defendants and their predecessors-in-interest were aware that the
8 scientific community had found that fossil fuel products, if their use continued to grow, would
9 cause global warming by the end of the century, and that such global warming would have wide-
10 ranging and costly consequences.

11 46. In 1968, API received a report from the Stanford Research Institute, which it had
12 hired to assess the state of research on environmental pollutants, including carbon dioxide.²¹ The
13 assessment stated: "Significant temperature changes are almost certain to occur by the year 2000,
14 and . . . there seems to be no doubt that the potential damage to our environment could be severe."
15 The scientists warned of "melting of the Antarctic ice cap" and informed API that "[p]ast and
16 present studies of CO₂ are detailed and seem to explain adequately the present state of CO₂ in the
17 atmosphere." What was missing, the scientists said, was work on "air pollution technology
18 and . . . systems in which CO₂ emissions would be brought under control."²²

19 47. In 1969, the Stanford Research Institute delivered a supplemental report on air
20 pollution to API, projecting with alarming particularity that atmospheric CO₂ concentrations
21 would reach 370 ppm by 2000.²³ This projection turned out to almost exactly match the actual
22 CO₂ concentrations measured in 2000 of 369.64 ppm.²⁴ The report explicitly connected the rise in

1 CO₂ levels to the combustion of fossil fuels, finding it “unlikely that the observed rise in
2 atmospheric CO₂ has been due to changes in the biosphere.”²⁵ By virtue of their membership and
3 participation in API at that time, the Fossil Fuel Defendants received or should have received the
4 Stanford Research Institute reports, and thus were on notice of the conclusions in those reports.²⁶

5 48. In 1977, James Black of Exxon gave a presentation to Exxon executives on the
6 “greenhouse effect,” which was summarized in an internal memo the following year. Black
7 reported that “current scientific opinion overwhelmingly favors attributing atmospheric carbon
8 dioxide increase to fossil fuel consumption,” and that doubling atmospheric carbon dioxide
9 would, according to the best climate model available, “produce a mean temperature increase of
10 about 2°C to 3°C over most of the earth,” with two to three times as much warming at the poles.²⁷
11 Black reported that the impacts of global warming would include “more rainfall,” which would
12 “benefit some areas and would harm others,” and that “[s]ome countries would benefit, but others
13 could have their agricultural output reduced or destroyed.” “Even those nations which are
14 favored, however, would be damaged for a while since their agricultural and industrial patterns
15 have been established on the basis of the present climate.” Finally, Black reported that “[p]resent
16 thinking holds that man has a time window of five to ten years before the need for hard decisions
17 regarding changes in energy strategies might become critical.”²⁸ The figure below, reproduced
18 from Black’s memo, illustrates Exxon’s understanding of the timescale and magnitude of global
19 warming that its products would cause.

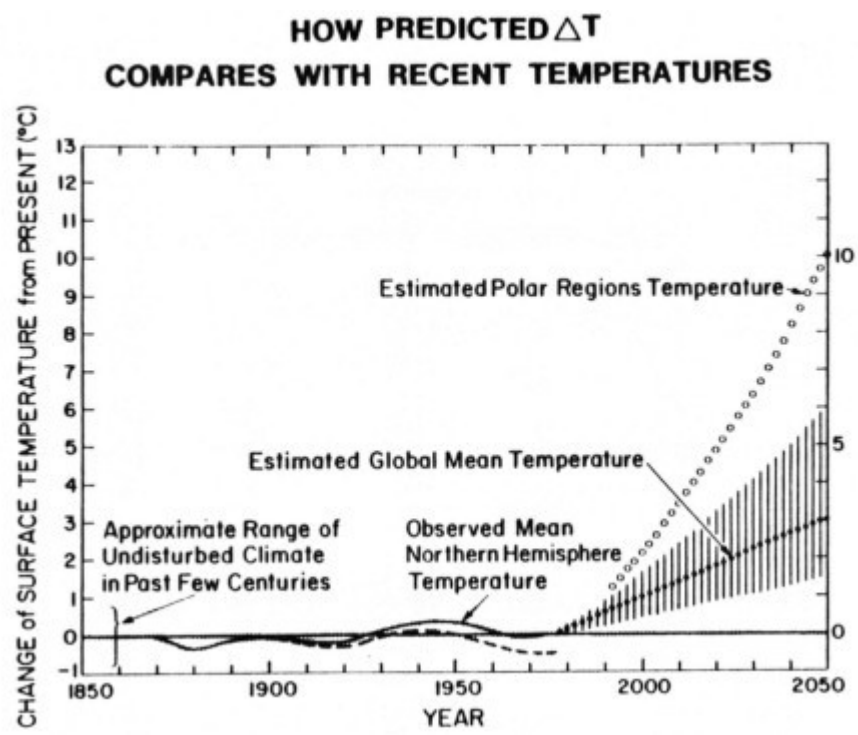

Figure 3: Future Global Warming Predicted Internally by Exxon in 1978²⁹

49. In 1979, an internal Exxon memorandum stated, “The most widely held theory [about the increase in CO₂ concentration in the atmosphere] is that: The increase is due to fossil fuel combustion; [i]ncreasing CO₂ concentration will cause a warming of the earth’s surface; [and t]he present trend of fossil fuel consumption will cause dramatic environmental effects before the year 2050. . . . The potential problem is great and urgent.” The memo added that, if limits were not placed on fossil fuel production,

Noticeable temperature changes would occur around 2010 as the [CO₂] concentration reaches 400 ppm. Significant climatic changes occur around 2035 when the concentration approaches 500 ppm. A doubling of the pre-industrial concentration [i.e., 580 ppm] occurs around 2050. The doubling would bring about dramatic changes in the world’s environment[.]³⁰

²⁹ *Id.* at p. 26. The company predicted global warming of 1°C to 3°C by 2050, with 10°C warming in polar regions. The difference between the lower dashed and solid curves prior to 1977 represents global warming that Exxon believed may already have been occurring. (*Ibid.*)

³⁰ W.L. Ferrall, Exxon Research and Engineering Co., memorandum to Dr. R.L. Hirsch re Controlling Atmospheric CO₂ (Oct. 16, 1979) pp. 1-2, 5, available at <https://www.industrydocuments.ucsf.edu/docs/mqw10228> (as of June 5, 2024).

1 50. Those projections proved remarkably accurate. Annual average atmospheric CO₂
2 concentrations surpassed 400 ppm in 2015 for the first time in millions of years.³¹ Limiting the
3 carbon dioxide concentration in the atmosphere to 440 ppm, or a 50% increase over preindustrial
4 levels, which the Exxon memo said was “assumed to be a relatively safe level for the
5 environment,” would require fossil fuel emissions to peak in the 1990s and non-fossil energy
6 systems to be rapidly deployed. Eighty percent of fossil fuel resources, the memo calculated,
7 would have to be left in the ground to avoid doubling atmospheric carbon dioxide concentrations.
8 Certain fossil fuels, such as shale oil, could not be substantially exploited at all.³²

9 51. But instead of heeding these dire and repeated warnings, in November 1979,
10 according to internal correspondence, Exxon urged “a very aggressive defensive program in . . .
11 atmospheric science and climate because there is a good probability that legislation affecting our
12 business will be passed.”³³ It urged an expanded research effort to “influence possible legislation
13 on environmental controls” and suggested the formation of a “small task force” to evaluate a
14 potential program in CO₂ and climate, acid rain, carcinogens, fine particulates, and other pollution
15 issues caused by fossil fuels.³⁴

16 52. In 1979, API and its members, including the Fossil Fuel Defendants, convened a Task
17 Force to monitor and share cutting-edge climate research among members of the oil industry.
18 This Climate and Energy Task Force (hereinafter referred to as “CO₂ Task Force”) included
19 senior scientists and engineers from nearly every major U.S. and multinational oil and gas
20 company—including Exxon, Mobil, Amoco, Phillips, Texaco, Shell, and Standard Oil of Ohio, as
21 well as Standard Oil of California and Gulf Oil, the predecessors to Chevron—and was charged
22 with monitoring research, evaluating the implications of emerging science for the petroleum and

1 gas industries, and identifying where potential reductions in GHG emissions from Defendants’
2 fossil fuel products could be made.³⁵

3 53. In 1979, a paper prepared by API for the CO₂ Task Force asserted that CO₂
4 concentrations were rising, and predicted that, although global warming would occur, it would
5 likely go undetected until approximately the year 2000 because its effects were being temporarily
6 masked by a natural cooling trend, which would revert to a warming trend around 1990, adding to
7 the warming caused by CO₂.³⁶

8 54. In 1980, at the invitation of the CO₂ Task Force, climate expert J. Laurman delivered
9 to API members a presentation providing a “complete technical discussion” of global warming
10 caused by fossil fuels, including “the scientific basis and technical evidence of CO₂ buildup,
11 impact on society, methods of modeling and their consequences, uncertainties, policy
12 implications, and conclusions that can be drawn from present knowledge.”³⁷ Laurmann informed
13 the CO₂ Task Force of the “scientific consensus on the potential for large future climatic response
14 to increased CO₂ levels” and that there was “strong empirical evidence that [the carbon dioxide]
15 rise [was] caused by anthropogenic release of CO₂, mainly from fossil fuel burning.”³⁸ According
16 to Laurmann, unless fossil fuel production and use were controlled, atmospheric carbon dioxide
17 would be twice preindustrial levels by 2038, using a 3% per annum growth of atmospheric release
18 rate, with “likely impacts” along the following trajectory:

19 1°C RISE (2005): BARELY NOTICEABLE

20 2.5°C RISE (2038): MAJOR ECONOMIC CONSEQUENCES, STRONG
REGIONAL DEPENDENCE

21 5°C RISE (2067): GLOBALLY CATASTROPHIC EFFECTS

³⁸ *Id.* at pp. 9-10 (full capitalization in original removed).

1 Laurmann warned the CO₂ Task Force that global warming of 2.5°C would “bring[] world
2 economic growth to a halt.” The minutes of the meeting, which were distributed to the entire CO₂
3 Task Force, show that one of the Task Force’s goals was “to help develop ground rules for ... the
4 cleanup of fuels as they relate to CO₂ creation,” and the Task Force discussed potential research
5 into the market and technical requirements for a worldwide “energy source changeover” away
6 from fossil fuels.³⁹

7 55. In 1980, a Canadian Esso (Exxon) company reported to managers and staff at
8 affiliated Esso and Exxon companies that there was “no doubt” that fossil fuels were aggravating
9 the build-up of CO₂ in the atmosphere, and that “[t]echnology exists to remove CO₂ from stack
10 gases but removal of only 50% of the CO₂ would double the cost of power generation.”⁴⁰

11 56. In December 1980, an Exxon manager distributed a memorandum on the “CO₂
12 Greenhouse Effect” attributing future buildup of carbon dioxide to fossil fuel use, and explaining
13 that internal calculations indicated that atmospheric carbon dioxide could double by around 2060,
14 “most likely” resulting in global warming of approximately 3.0 ± 1.5°C.⁴¹ Calculations predicting
15 a lower temperature increase, such as 0.25°C, were “not held in high regard by the scientific
16 community[.]” The memo also reported that such global warming would cause “increased
17 rainfall[] and increased evaporation,” which would have a “dramatic impact on soil moisture, and
18 in turn, on agriculture” and other “serious global problems[.]” The memo called for “society” to
19 pay the bill, estimating that some adaptive measures would cost no more than “a few percent” of
20 Gross National Product.⁴² Shaw also reported that Exxon had studied various responses for
21 avoiding or reducing a carbon dioxide build-up, including “stopping all fossil fuel combustion at
22 the 1980 rate” and “investigat[ing] the market penetration of non-fossil fuel technologies.” The

⁴² *Id.* at pp. 3-5.

1 memo estimated that such non-fossil energy technologies “would need about 50 years to penetrate
2 and achieve roughly half of the total [energy] market.”⁴³ The memo included the figure below,
3 which illustrates both the global warming anticipated by Exxon and the company’s understanding
4 that significant global warming would occur:

17 **Figure 4: Future Global Warming Predicted Internally by Exxon in 1980⁴⁴**

18 57. In February 1981, Exxon’s Contract Research Office prepared and distributed a
19 “Scoping Study on CO₂” to the leadership of Exxon Research and Engineering Company.⁴⁵ The
20 study reviewed Exxon’s carbon dioxide research and considered whether to expand its research
21 on carbon dioxide or global warming further. It recommended against expanding those research
22 areas because Exxon’s current research programs were sufficient for achieving the company’s
23 goals of closely monitoring federal research, building credibility and public relations value, and
24

25 ⁴³ *Id.* at pp. 5-6.

26 ⁴⁴ *Id.* at p. 12. The company anticipated a doubling of carbon dioxide by around 2060 and
27 that the oceans would delay the warming effect by a few decades, leading to approximately 3°C
28 warming by the end of the century.

⁴⁵ G.H. Long, Exxon Research and Engineering Co., letter to P.J. Lucchesi et al. re
Atmospheric CO Scoping Study (Feb. 5, 1981),
<https://www.industrydocuments.ucsf.edu/docs/yxfl0228> (as of June 5, 2024).

1 developing in-house expertise regarding CO₂ and global warming, and noted that Exxon
2 employees were actively monitoring and keeping the company apprised of outside research
3 developments, including those on climate modeling and “CO₂-induced effects.” In discussing
4 “options for reducing CO₂ build-up in the atmosphere,” the study noted that although capturing
5 CO₂ from flue gases (i.e., exhaust gas produced by combustion) was technologically possible, the
6 cost was high, and “energy conservation or shifting to renewable energy sources[] represent the
7 only options that might make sense.”⁴⁶

8 58. Thus, by 1981, Exxon and other fossil fuel companies were actively monitoring all
9 aspects of CO₂ and global warming research, and Exxon had recognized that a shift away from
10 fossil fuels and towards renewable energy sources would be necessary to avoid a large CO₂ build-
11 up in the atmosphere and resultant global warming.

12 59. An Exxon scientist warned colleagues in a 1981 internal memorandum that “future
13 developments in global data gathering and analysis, along with advances in climate modeling,
14 may provide strong evidence for a delayed CO₂ effect of a truly substantial magnitude,” and that
15 under certain circumstances it would be “very likely that we will unambiguously recognize the
16 threat by the year 2000.”⁴⁷ The memo expressed concern about the potential effects of unabated
17 CO₂ emissions from Defendants’ fossil fuel products, saying, “it is distinctly possible that [Exxon
18 Planning Division’s] scenario will later produce effects which will indeed be catastrophic (at least
19 for a substantial fraction of the world’s population).”⁴⁸

20 60. In 1982, another report prepared for API by climate scientists recognized that the
21 atmospheric CO₂ concentration had risen significantly compared to the concentration at the
22 beginning of the industrial revolution. It went further, warning that “[s]uch a warming can have
23 serious consequences for man’s comfort and survival since patterns of aridity and rainfall can
24 change, the height of the sea level can increase considerably and the world food supply can be

consequences-of-fossil-fuel-consumption](http://www.climatefiles.com/exxonmobil/1981-exxon-memo-on-possible-emission-consequences-of-fossil-fuel-consumption) (as of June 5, 2024).

28 ⁴⁸ *Ibid.*

1 affected.”⁴⁹ Exxon’s own modeling research confirmed this.⁵⁰ In a 1982 internal memorandum,
2 Exxon’s Corporate Research and Science Laboratories acknowledged a consensus “that a
3 doubling of atmospheric CO₂ from its pre-industrial revolution value would result in an average
4 global temperature rise of (3.0 ± 1.5)°C [5.4 ± 2.7 °F]” as well as “unanimous agreement in the
5 scientific community that a temperature increase of this magnitude would bring about significant
6 changes in the earth’s climate[.]”⁵¹

7 61. Also in 1982, Exxon’s Environmental Affairs Manager distributed a primer on
8 climate change to Exxon management; it was “restricted to Exxon personnel and not [to be]
9 distributed externally.”⁵² The primer explained the science behind climate change, confirmed
10 fossil fuel combustion as a primary anthropogenic contributor to global warming, and estimated a
11 CO₂ doubling by 2090 with a “Most Probable Temperature Increase” of more than 2°C over the
12 1979 level, as shown in the figure on the following page.⁵³ The report also warned that
13 “disturbances in the existing global water distribution balance would have dramatic impact on soil
14 moisture, and in turn, on agriculture,” and that the American Midwest would become much drier.
15 It further warned of “potentially catastrophic effects that must be considered[.]”⁵⁴ It concluded
16 that “[a]ll biological systems are likely to be affected,” and “the most severe economic effects
17 could be on agriculture.”⁵⁵

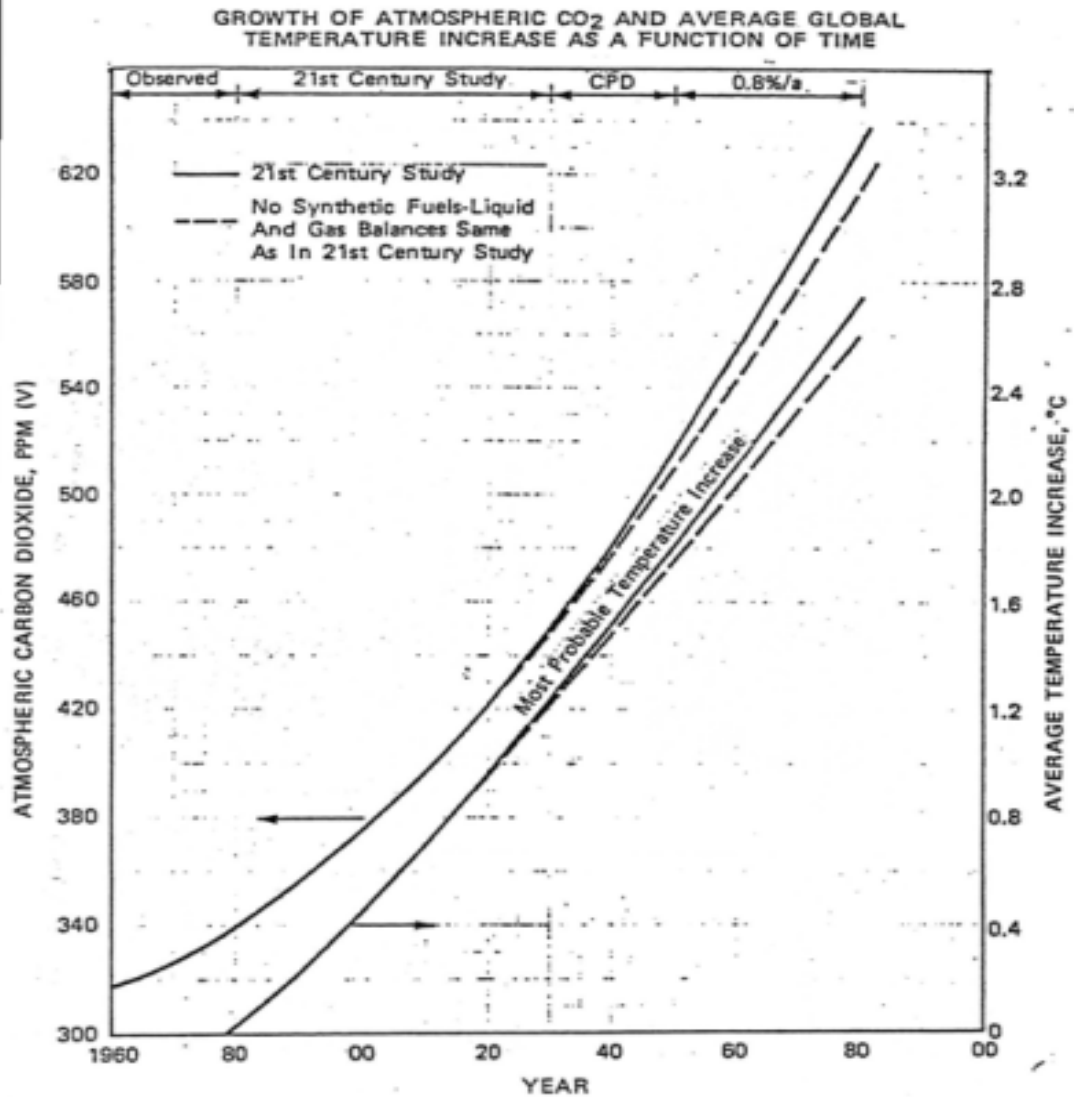

Figure 5: Exxon’s Internal Prediction of Future CO₂ Increase and Global Warming from 1982⁵⁶

62. The report recommended studying “soil erosion, salinization, or the collapse of irrigation systems” in order to understand how society might be affected and might respond to global warming, as well as “[h]ealth effects” and “stress associated with climate related famine or migration[.]”⁵⁷ The report estimated that undertaking “[s]ome adaptive measures” (not all of them) would cost “a few percent of the gross national product estimated in the middle of the next

⁵⁶ *Id.* at p. 7. The company predicted a doubling of atmospheric carbon dioxide concentrations above preindustrial levels by around 2090 (left curve), with a temperature increase of more than 2°C over the 1979 level (right curve).

⁵⁷ *Id.* at p. 14.

1 century” (gross national product was \$25,640 billion in 2022).⁵⁸ To avoid such impacts, the report
2 discussed a scientific analysis which studied energy alternatives and requirements for introducing
3 them into widespread use, and which recommended that “vigorous development of non-fossil
4 energy sources be initiated as soon as possible.”⁵⁹ The primer also noted that the analysis
5 indicated that other greenhouse gases related to fossil fuel production, such as methane (which is
6 a more powerful GHG than CO₂), “may significantly contribute to a global warming,” and that
7 concerns over CO₂ would be reduced if fossil fuel use were decreased due to “high price, scarcity,
8 [or] unavailability.”⁶⁰ “Mitigation of the ‘greenhouse effect’ would require major reductions in
9 fossil fuel combustion,” the primer stated.⁶¹ The primer was widely distributed to Exxon
10 leadership.

11 63. In September 1982, the Director of Exxon’s Theoretical and Mathematical Sciences
12 Laboratory, Roger Cohen, wrote Alvin Natkin of Exxon’s Office of Science and Technology to
13 summarize Exxon’s internal research on climate modeling.⁶² Cohen reported:

14 [O]ver the past several years a clear scientific consensus has emerged regarding
15 the expected climatic effects of increased atmospheric CO₂. The consensus is that
16 a doubling of atmospheric CO₂ from its pre-industrial revolution value would
17 result in an average global temperature rise of (3.0 ± 1.5) °C. . . . The temperature
18 rise is predicted to be distributed nonuniformly over the earth, with above-average
19 temperature elevations in the polar regions and relatively small increases near the
20 equator. There is unanimous agreement in the scientific community that a
21 temperature increase of this magnitude would bring about significant changes in
22 the earth’s climate, including rainfall distribution and alterations in the biosphere.
23 The time required for doubling of atmospheric CO₂ depends on future world
24 consumption of fossil fuels. Current projections indicate that doubling will occur
25 sometime in the latter half of the 21st century. The models predict that CO₂ climate
26 changes should be observable well before doubling. It is generally believed that
27 the first CO₂-induced temperature increase will not be observable until around the
28 year 2000.

24 ⁵⁸ *Ibid.*; See Federal Reserve Bank of St. Louis, Gross National Product (updated Mar. 30,
25 2023), available at <https://fred.stlouisfed.org/series/GNPA> (as of June 5, 2024).

26 ⁶¹ *Id.* at p. 2.

27 ⁶² Roger W. Cohen, Exxon Research and Engineering Co., memorandum to A.M. Natkin,
28 Exxon Corp. Office of Science and Technology (Sept. 2, 1982), available at
[https://www.climatefiles.com/exxonmobil/1982-exxon-memo-summarizing-climate-modeling-
and-co2-greenhouse-effect-research/](https://www.climatefiles.com/exxonmobil/1982-exxon-memo-summarizing-climate-modeling-and-co2-greenhouse-effect-research/) (as of June 5, 2024).

1 Cohen described Exxon’s own climate modeling experiments, reporting that they produced “a
2 global averaged temperature increase that falls well within the range of the scientific consensus,”
3 were “consistent with the published predictions of more complex climate models,” and were “also
4 in agreement with estimates of the global temperature distribution during a certain prehistoric
5 period when the earth was much warmer than today.” “In summary,” Cohen wrote, “the results of
6 our research are in accord with the scientific consensus on the effect of increased atmospheric
7 CO₂ on climate.”

8 64. Throughout the early 1980s, at Exxon’s direction, Exxon climate scientist Henry
9 Shaw forecasted emissions of CO₂ from fossil fuel use. Those estimates were incorporated into
10 Exxon’s twenty-first century energy projections and were distributed among Exxon’s various
11 divisions. Shaw’s conclusions included an expectation that atmospheric CO₂ concentrations
12 would double in 2090 per the Exxon model, with an attendant 2.3–5.6°F average global
13 temperature increase.⁶³

14 65. During the 1980s, many Defendants formed their own research units focused on
15 climate modeling. API, including the API CO₂ Task Force, provided a forum for the Fossil Fuel
16 Defendants to share their research efforts and corroborate their findings related to anthropogenic
17 GHG emissions.⁶⁴

18 66. In 1988, the Shell Greenhouse Effect Working Group issued a confidential internal
19 report, “The Greenhouse Effect,” which acknowledged global warming’s anthropogenic nature:
20 “Man-made carbon dioxide, released into and accumulated in the atmosphere, is believed to warm
21 the earth through the so-called greenhouse effect.” The authors also noted the burning of fossil
22 fuels as a primary driver of CO₂ buildup and warned that warming could “create significant

27 <https://insideclimatenews.org/news/22122015/exxon-mobil-oil-industry-peers-knew-about-climate-change-dangers-1970s-american-petroleum-institute-api-shell-chevron-texaco/> (as of
28 June 5, 2024).

1 changes in sea level, ocean currents, precipitation patterns, regional temperature and weather.”
2 They further pointed to the potential for “direct operational consequences” of sea level rise on
3 “offshore installations, coastal facilities and operations (e.g. platforms, harbors, refineries,
4 depots).”⁶⁵

5 67. The Shell report noted that “by the time the global warming becomes detectable it
6 could be too late to take effective countermeasures to reduce the effects or even to stabilise the
7 situation.” The authors mentioned the need to consider policy changes, noting that “the potential
8 implications for the world are . . . so large that policy options need to be considered much
9 earlier,” and that research should be “directed more to the analysis of policy and energy options
10 than to studies of what we will be facing exactly.”⁶⁶

11 68. In 1991, a researcher for Exxon’s subsidiary Imperial Oil stated to an audience of
12 engineers that greenhouse gases are rising “due to the burning of fossil fuels. . . . Nobody disputes
13 this fact.”⁶⁷

14 69. The fossil fuel industry was at the forefront of carbon dioxide research for much of
15 the latter half of the twentieth century. It worked with many of the field’s top researchers to
16 produce exceptionally sophisticated studies and models. For instance, as early as the 1980s, Shell
17 began developing and employing scenarios to plan how the company could respond to various
18 global forces in the future. In a confidential 1989 scenario planning report, Shell noted that
19 evidence “that mankind and his actions could affect the climate . . . is strong and accumulating
20 fast.” In that report, Shell evaluated a scenario it called “Sustainable World,” which would
21 address climate change by reducing CO₂ emissions to 1989 levels by 2010. Contrasting the
22 “Sustainable World” scenario with another scenario titled “Global Mercantilism,” Shell reported
23 that under a “Sustainable World” scenario, global temperatures would likely increase between 0.5

24
25 ⁶⁵ Shell Internationale Petroleum, Greenhouse Effect Working Group, *The Greenhouse Effect* (May 1988) pp. 1, 27, available at <https://www.documentcloud.org/documents/4411090-Documents3.html#document/p9/a411239> (as of June 5, 2024).

26 ⁶⁶ *Id.* at pp. 1, 6.

27 ⁶⁷ Jerving et al., *Special Report: What Exxon Knew About Global Warming’s Impact on the Arctic*, *L.A. Times* (Oct. 10, 2015), available at <https://www.latimes.com/business/la-na-adv-exxon-arctic-20151011-story.html> (as of June 5, 2024).

1 and 1.5 degrees Celsius from CO₂ concentration increases that had already occurred by 1989, but
2 the scenario “could mitigate the problem.” In contrast, under the “Global Mercantilism” scenario,
3 which forecasted a continual increase in CO₂ emissions, CO₂ concentrations and temperatures
4 would rise considerably higher.⁶⁸

5 70. In another scenario, published in a 1998 internal report, Shell paints an eerily
6 prescient scene:

7 In 2010, a series of violent storms causes extensive damage to the eastern coast
8 of the US. Although it is not clear whether the storms are caused by climate
9 change, people are not willing to take further chances. The insurance industry
10 refuses to accept liability, setting off a fierce debate over who is liable: the
11 insurance industry, or the government. After all, two successive IPCC reports
12 since 1995 have reinforced the human connection to climate change . . .
13 Following the storms, a coalition of environmental NGOs brings a class-
14 action suit against the US government and fossil-fuel companies on the grounds
15 of neglecting what scientists (including their own) have been saying for years:
16 that something must be done. A social reaction to the use of fossil fuels grows,
17 and individuals become ‘vigilante environmentalists’ in the same way, a
18 generation earlier, they had become fiercely anti-tobacco. Direct-action
19 campaigns against companies escalate. Young consumers, especially, demand
20 action.⁶⁹

21 71. Fossil fuel companies did not just consider climate change impacts in scenarios; they
22 also incorporated those impacts in their on-the-ground planning. In the mid-1990s, Exxon, Shell,
23 and Imperial Oil (Exxon) jointly undertook the Sable Offshore Energy Project in Nova Scotia.
24 The project’s own Environmental Impact Statement declared, “The impact of a global warming
25 sea-level rise may be particularly significant in Nova Scotia. The long-term tide gauge records at
26 a number of locations along the N.S. coast have shown sea level has been rising over the past
27 century. . . . For the design of coastal and offshore structures, an estimated rise in water level, due

1 to global warming, of 0.5 m [1.64 feet] may be assumed for the proposed project life (25
2 years).”⁷⁰

3 72. Climate change research conducted by Defendants and their industry associations
4 frequently acknowledged uncertainties in their climate modeling. Those uncertainties, however,
5 were largely with respect to the magnitude and timing of climate impacts resulting from fossil
6 fuel consumption, not with respect to whether significant changes would eventually occur.
7 Defendants’ researchers and the researchers at their industry associations harbored little doubt
8 that climate change was occurring and that fossil fuel products were, and are, the primary cause.

9 73. Despite the overwhelming information about the threats to people and the planet
10 posed by continued unabated use of their fossil fuel products, the Fossil Fuel Defendants failed to
11 act as they reasonably should have to avoid or mitigate those dire adverse impacts. The Fossil
12 Fuel Defendants instead undertook affirmative efforts to promote their fossil fuel products as safe
13 and cast doubt in the public’s mind about the burgeoning scientific consensus on climate change,
14 as described below. This was an abdication of the Fossil Fuel Defendants’ responsibility to
15 consumers and the public, including the State, to act on their knowledge of the reasonably
16 foreseeable hazards of unabated production and consumption of their fossil fuel products.

17 **C. Defendants Did Not Disclose Known Harms Associated with the Intended**
18 **Use of Fossil Fuel Products, and Instead Affirmatively Concealed Those**
19 **Harms by Engaging in a Campaign of Deception to Increase the Use of**
20 **Those Products**

21 74. By 1980, Defendants had amassed a compelling body of knowledge about the role of
22 anthropogenic greenhouse gases, specifically those emitted from the use of fossil fuel products, in
23 causing climate change and its cascading impacts, including disruptions to the hydrologic cycle,
24 extreme precipitation, extreme drought, increasing temperatures, and associated consequences for
25 human communities and the environment.

26 75. On notice that their products were causing global climate change and dire effects on
27 the planet, the Fossil Fuel Defendants and API faced the decision whether to take steps to limit

28 ⁷⁰ ExxonMobil, *Sable Project Development Plan*, vol. 3, Environmental Impact Statement
(Feb. 1996), pp. 4-77.

1 the damage that the use of fossil fuel products was causing and would continue to cause Earth's
2 inhabitants, including the people of California. Before or thereafter, Defendants could and
3 reasonably should have taken any number of steps to mitigate the damage caused by the use of
4 fossil fuel products. Their own comments reveal an awareness of what steps should have been
5 taken. Defendants should have warned civil society and California consumers of the dangers
6 known to Defendants of the unabated use of fossil fuel products, and they could and should have
7 taken reasonable steps to limit the greenhouse gases emitted by use of fossil fuel products. This
8 would have allowed policymakers to act sooner and more quickly to limit fossil fuel consumption
9 and accelerate the transition to non-carbon sources. This work is now underway, but was
10 wrongfully delayed by Defendants' deception. Simply put, Defendants should have issued
11 warnings commensurate with their own understanding of the risks posed by the expected and
12 intended uses of fossil fuel products. Instead, they put their profits first.

13 76. Not only did Defendants fail to issue any warnings, but several key events during the
14 period between 1988 and 1992 prompted them to change their tactics from pursuing, then
15 concealing, general research and internal discussion on climate change to engaging in a public
16 campaign aimed at deceiving consumers and the public, including the inhabitants of California.
17 These key events included the following:

18 a. In 1988, National Aeronautics and Space Administration (NASA) scientists
19 confirmed that human activities were actually contributing to global warming. On June 23, 1988,
20 NASA scientist James Hansen's presentation of this information to Congress engendered
21 significant news coverage and publicity for the announcement, including coverage on the front
22 page of *The New York Times*.⁷¹

23 b. On July 28, 1988, Senator Robert Stafford and four bipartisan co-sponsors
24 introduced S. 2666, "The Global Environmental Protection Act," to regulate CO₂ and other
25 greenhouse gases. Three more bipartisan bills to significantly reduce CO₂ pollution were
26 introduced over the following ten weeks, and in August, U.S. Presidential candidate George H.W.

27 ⁷¹ See Frumhoff et al., *The Climate Responsibilities of Industrial Carbon Producers*
28 (2015) 132 *Climatic Change* 157, 161, available at <http://dx.doi.org/10.1007/s10584-015-1472-5>
(as of June 5, 2024).

1 Bush pledged that his presidency would combat the greenhouse effect with “the White House
2 effect.”⁷² Political will in the United States to reduce anthropogenic GHG emissions and mitigate
3 the harms associated with Defendants’ fossil fuel products was gaining momentum.

4 c. In December 1988, the United Nations formed the IPCC, a scientific panel
5 dedicated to providing the world’s governments with an objective, scientific analysis of climate
6 change and its environmental, political, and economic impacts.

7 d. In 1990, the IPCC published its First Assessment Report on anthropogenic
8 climate change,⁷³ which concluded that (1) “there is a natural greenhouse effect which already
9 keeps the Earth warmer than it would otherwise be,” and (2) that

10 emissions resulting from human activities are substantially increasing the
11 atmospheric concentrations of the greenhouse gases: carbon dioxide, methane,
12 chlorofluorocarbons (CFCs) and nitrous oxide. These increases will enhance the
13 greenhouse effect, resulting on average in an additional warming of the Earth’s
14 surface. The main greenhouse gas, water vapour, will increase in response to global
15 warming and further enhance it.⁷⁴

16 The IPCC reconfirmed those conclusions in a 1992 supplement to the First Assessment Report.⁷⁵

17 e. The United Nations held the 1992 Earth Summit in Rio de Janeiro, Brazil, a
18 major, newsworthy gathering of over 170 world governments, of which more than 100 sent their
19 heads of state. The Summit resulted in the United Nations Framework Convention on Climate
20 Change, an international environmental treaty providing protocols for future negotiations aimed
21 at “stabiliz[ing] greenhouse gas concentrations in the atmosphere at a level that would prevent
22 dangerous anthropogenic interference with the climate system.”⁷⁶

23 77. Defendants’ campaign of deception focused on concealing, discrediting, and/or
24 misrepresenting information that tended to support restricting the use of fossil fuels and

2, p. 4, available at <https://unfccc.int/resource/docs/convkp/conveng.pdf> (as of June 5, 2024).

1 transitioning society to a lower-carbon future, thereby decreasing demand for Fossil Fuel
2 Defendants' products. The campaign enabled the Fossil Fuel Defendants to continue their
3 business practice of exploiting fossil fuel reserves and concurrently externalizing the social and
4 environmental costs of their fossil fuel products. Those activities ran counter to Defendants' own
5 prior recognition that the science of anthropogenic climate change was clear, and that action was
6 needed to avoid or mitigate dire consequences to the planet and to communities like California's.

7 78. The Fossil Fuel Defendants—both on their own and jointly through industry and front
8 groups such as API and the GCC—funded, conceived, planned, and carried out a sustained and
9 widespread campaign of denial and disinformation about the existence of climate change and
10 their products' contribution to it. The campaign included a long-term pattern of direct
11 misrepresentations and material omissions, as well as a plan to influence consumers indirectly by
12 affecting public opinion through the dissemination of misleading information to the press,
13 government, and academia. Although the Fossil Fuel Defendants were competitors in the
14 marketplace, they combined and collaborated with each other and with API on this public
15 campaign to misdirect and stifle public knowledge in order to increase sales and protect profits.
16 The effort included promoting hazardous fossil fuel products through advertising campaigns that
17 failed to warn of the existential risks associated with the use of those products and that were
18 designed to influence consumers to continue using the Fossil Fuel Defendants' fossil fuel
19 products, irrespective of those products' damage to communities and the environment.

20 79. For example, in 1988, Joseph Carlson, an Exxon public affairs manager, stated in an
21 internal memo that Exxon "is providing leadership through API in developing the petroleum
22 industry position" on "the greenhouse effect."⁷⁷ He then went on to describe the "Exxon
23 Position," which included two important messaging tenets, among others: (1) "[e]mphasize the
24 uncertainty in scientific conclusions regarding the potential enhanced Greenhouse effect"; and (2)

25
26
27 ⁷⁷ Joseph M. Carlson, memorandum re The Greenhouse Effect (Aug. 3, 1988) p. 7,
28 available at <https://assets.documentcloud.org/documents/3024180/1998-Exxon-Memo-on-the-Greenhouse-Effect.pdf> (as of June 5, 2024).

1 “[r]esist the overstatement and sensationalization of potential Greenhouse effect which could lead
2 to noneconomic development of nonfossil fuel resources.”⁷⁸

3 80. Reflecting on his time as an Exxon consultant in the 1980s, Professor Martin Hoffert,
4 a former New York University physicist who researched climate change, expressed regret over
5 Exxon’s “climate science denial program campaign” in his sworn testimony before Congress:

6 [O]ur research [at Exxon] was consistent with findings of the United Nations
7 Intergovernmental Panel on Climate Change on human impacts of fossil fuel
8 burning, which is that they are increasingly having a perceptible influence on
9 Earth’s climate. . . . If anything, adverse climate change from elevated CO₂ is
10 proceeding faster than the average of the prior IPCC mild projections and fully
11 consistent with what we knew back in the early 1980’s at Exxon. . . . I was greatly
12 distressed by the climate science denial program campaign that Exxon’s front office
13 launched around the time I stopped working as a consultant—but not collaborator—
14 for Exxon. The advertisements that Exxon ran in major newspapers raising doubt
15 about climate change were contradicted by the scientific work we had done and
16 continue to do. Exxon was publicly promoting views that its own scientists knew
17 were wrong, and we knew that because we were the major group working on this.⁷⁹

18 81. A 1994 Shell report entitled “The Enhanced Greenhouse Effect: A Review of the
19 Scientific Aspects” by Royal Dutch Shell’s Peter Langcake stands in stark contrast to the
20 company’s 1988 report on the same topic. Whereas before the authors had recommended
21 consideration of policy solutions early on, Langcake warned of the potentially dramatic
22 “economic effects of ill-advised policy measures.” While the report recognized the IPCC
23 conclusions as the mainstream view, Langcake still falsely emphasized scientific uncertainty,
24 noting, for example, that “the postulated link between any observed temperature rise and human
25 activities has to be seen in relation to natural climate variability, which is still largely
26 unpredictable.” The Shell position is stated clearly in the report: “Scientific uncertainty and the
27 evolution of energy systems indicate that policies to curb greenhouse gas emissions beyond ‘no

27 York University, Examining the Oil Industry’s Efforts to Suppress the Truth About Climate
28 Change, Hearing Before the House Comm. on Oversight and Reform, Subcomm. on Civil Rights
and Civil Liberties, 116th Cong., 1st Sess., at pp. 7-8 (Oct. 23, 2019), available at
<https://www.congress.gov/event/116th-congress/house-event/110126> (as of June 5, 2024).

1 regrets' measures could be premature, divert resources from more pressing needs and further
2 distort markets.”⁸⁰

3 82. In 1996, Exxon released a publication called “Global Warming: Who’s Right? Facts
4 about a debate that’s turned up more questions than answers.” In the publication’s preface, Exxon
5 CEO Lee Raymond inaccurately stated that “taking drastic action immediately is unnecessary
6 since many scientists agree there’s ample time to better understand the climate system.” The
7 publication described the greenhouse effect as “unquestionably real and definitely a good thing,”
8 while ignoring the severe consequences that would result from the influence of the increased CO₂
9 concentration on the Earth’s climate. Instead, it characterized the greenhouse effect as simply
10 “what makes the earth’s atmosphere livable.” Directly contradicting Exxon’s own internal
11 knowledge and peer-reviewed science, the publication ascribed the rise in temperature since the
12 late nineteenth century to “natural fluctuations that occur over long periods of time” rather than to
13 the anthropogenic emissions that Exxon itself and other scientists had confirmed were
14 responsible. The publication also falsely challenged the computer models that projected the future
15 impacts of unabated fossil fuel product consumption, including those developed by Exxon’s own
16 employees, as having been “proved to be inaccurate.” The publication contradicted the numerous
17 reports prepared by and circulated among Exxon’s staff, and by API, stating that “the indications
18 are that a warmer world would be far more benign than many imagine . . . moderate warming
19 would reduce mortality rates in the U.S., so a slightly warmer climate would be more healthful.”
20 Raymond concluded his preface by attacking advocates for limiting the use of his company’s
21 fossil fuel products as “drawing on bad science, faulty logic or unrealistic assumptions”—despite
22 the important role that Exxon’s own scientists had played in compiling those same scientific
23 underpinnings.⁸¹

(as of June 5, 2024).

1 83. API published an extensive report in the same year warning against concern over CO₂
2 buildup and any need to curb consumption or regulate the fossil fuel industry. The introduction
3 stated that “there is no persuasive basis for forcing Americans to dramatically change their
4 lifestyles to use less oil.” The authors discouraged the further development of certain alternative
5 energy sources, writing that “government agencies have advocated the increased use of ethanol
6 and the electric car, without the facts to support the assertion that either is superior to existing
7 fuels and technologies” and that “[p]olicies that mandate replacing oil with specific alternative
8 fuel technologies freeze progress at the current level of technology, and reduce the chance that
9 innovation will develop better solutions.” The paper also denied the human connection to climate
10 change, by falsely stating that “no conclusive—or even strongly suggestive—scientific evidence
11 exists that human activities are significantly affecting sea levels, rainfall, surface temperatures or
12 the intensity and frequency of storms.” The report’s message was false but clear: “facts don’t
13 support the arguments for restraining oil use.”⁸²

14 84. In a speech presented at the World Petroleum Congress in Beijing in 1997 at which
15 many of the Defendants were present, Exxon CEO Lee Raymond reiterated those views. This
16 time, he presented a false dichotomy between stable energy markets and abatement of the
17 marketing, promotion, and sale of fossil fuel products Defendants knew to be hazardous. He
18 stated:

19 [S]ome people . . . argue that we should drastically curtail our use of fossil fuels for
20 environmental reasons . . . my belief [is] that such proposals are neither prudent nor
21 practical. With no readily available economic alternatives on the horizon, fossil
fuels will continue to supply most of the world’s and this region’s energy for the
foreseeable future.

22

23 Governments also need to provide a stable investment climate They should
24 avoid the temptation to intervene in energy markets in ways that give advantage to
one competitor over another—or one fuel over another.

25

26 We also have to keep in mind that most of the greenhouse effect comes from natural
sources Leaping to radically cut this tiny sliver of the greenhouse pie on the

28 *Choices* (1996) pp. 2, 11, 63, 79, available at
<https://www.documentcloud.org/documents/4224133-Reinventing-Energy> (as of June 5, 2024).

1 premise that it will affect climate defies common sense and lacks foundation in our
2 current understanding of the climate system.

3

4 [L]et's agree there's a lot we really don't know about how climate will change in
5 the 21st century and beyond It is highly unlikely that the temperature in the
6 middle of the next century will be significantly affected whether policies are
7 enacted now or 20 years from now. . . . It's bad public policy to impose very costly
8 regulations and restrictions when their need has yet to be proven.⁸³

9 85. Imperial Oil (Exxon) CEO Robert Peterson falsely denied the established connection
10 between the Fossil Fuel Defendants' fossil fuel products and anthropogenic climate change in an
11 essay in the Summer 1998 issue of Imperial Oil's magazine, "Imperial Oil Review":

12 [T]his issue [referring to climate change] has absolutely nothing to do with
13 pollution and air quality. Carbon dioxide is not a pollutant but an essential
14 ingredient of life on this planet. . . . [T]he question of whether or not the trapping
15 of "greenhouse" gases will result in the planet's getting warmer . . . has no
16 connection whatsoever with our day-to-day weather.

17

18 There is absolutely no agreement among climatologists on whether or not the planet
19 is getting warmer or, if it is, on whether the warming is the result of man-made
20 factors or natural variations in the climate. . . . I feel very safe in saying that the
21 view that burning fossil fuels will result in global climate change remains an
22 unproved hypothesis.⁸⁴

23 86. Mobil (Exxon) paid for a series of "advertorials," advertisements located in the
24 editorial section of *The New York Times* and meant to look like editorials rather than paid ads.
25 Many of those advertorials communicated doubt about the reality and severity of human-caused
26 climate change, even as industry scientists contemporaneously reiterated that climate change was
27 real, serious, and caused by human activity. The ads addressed various aspects of the public
28 discussion of climate change and sought to undermine the justifications for tackling GHG
emissions as unsettled science. The 1997 advertorial on the following page argued that economic
analysis of emissions restrictions was faulty and inconclusive and therefore provided a
justification for delaying action on climate change.

When facts don't square with the theory, throw out the facts

That seems to characterize the administration's attitude on two of its own studies which show that international efforts to curb global warming could spark a big run-up in energy prices.

For months, the administration—playing its cards close to the vest—has promised to provide details of the emission reduction plan it will put on the table at the climate change meeting in Kyoto, Japan, later this year. It also promised to evaluate the economics of that policy and measure its impact. Those results are important because the proposals submitted by other countries thus far would be disruptive and costly to the U.S. economy.

Yet, when the results from its own economic models were finally generated, the administration started distancing itself from the findings and models that produced them. The administration's top economic advisor said that economic models can't provide a "definitive answer" on the impact of controlling emissions. The effort, she said, was "futile." At best, the models can only provide a "range of potential impacts."

Frankly, we're puzzled. The White House has promised to lay the economic facts before the public. Yet, the administration's top advisor said such an analysis won't be based on models and it will "preclude... detailed numbers." If you don't provide numbers and don't rely on models, what kind of rigorous economic examination can Congress and the public expect?

We're also puzzled by ambivalence over models. The administration downplays the utility of economic models to forecast cost impacts 10-15 years from now, yet its negotiators accept as gospel the 50-100-year predictions of global warming that have been generated by climate models—many of which have been criticized as seriously flawed.

The second study, conducted by Argonne National Laboratory under a contract with the Energy Department, examined what would

happen if the U.S. had to commit to higher energy prices under the emission reduction plans that several nations had advanced last year. Such increases, the report concluded, would result in "significant reductions in output and employment" in six industries—aluminum, cement, chemical, paper and pulp, petroleum refining and steel.

Hit hardest, the study noted, would be the chemical industry, with estimates that up to 30 percent of U.S. chemical manufacturing capacity would move offshore to developing countries. Job losses could amount to some 200,000 in that industry, with another 100,000 in the steel sector. And despite the substantial loss of U.S. jobs and manufacturing capacity, the net emission reduction could be insignificant since developing countries will not be bound by the emission targets of a global warming treaty.

Downplaying Argonne's findings, the Energy Department noted that the study used outdated energy prices (mid-1996), didn't reflect the gains that would come from international emissions trading and failed to factor in the benefits of accelerated developments in energy efficiency and low-carbon technologies.

What it failed to mention is just what these new technologies are and when we can expect their benefits to kick in. As for emissions trading, many economists have theorized about the role they could play in reducing emissions, but few have grappled with the practicality of implementing and policing such a scheme.

We applaud the goals the U.S. wants to achieve in these upcoming negotiations—namely, that a final agreement must be "flexible, cost-effective, realistic, achievable and ultimately global in scope." But until we see the details of the administration's policy, we are concerned that plans are being developed in the absence of rigorous economic analysis. Too much is at stake to simply ignore facts that don't square with preconceived theories.

Mobil The energy
to make a difference.

<http://www.mobil.com>

©1997 Mobil Corporation

Figure 6: 1997 Mobil Advertorial⁸⁵

1 87. Many other Exxon and Mobil advertorials falsely or misleadingly characterized the
2 state of climate science research to the readership of *The New York Times*'s op-ed page. A sample
3 of misleading or outright untruthful statements in paid advertisements that resembled op-eds
4 includes the following:

- 5 • “We don’t know enough about the factors that affect global warming and the degree
6 to which—if any—that man-made emissions (namely, carbon dioxide) contribute to
7 increases in Earth’s temperature.”⁸⁶
- 8 • “[G]reenhouse-gas emissions, which have a warming effect, are offset by another
9 combustion product—particulates—which leads to cooling.”⁸⁷
- 10 • “Even after two decades of progress, climatologists are still uncertain how—or even
11 if—the buildup of man-made greenhouse gases is linked to global warming.”⁸⁸
- 12 • “[I]t is impossible for scientists to attribute the recent small surface temperature
13 increase to human causes.”⁸⁹

14 88. A quantitative analysis of Exxon’s climate communications between 1989 and 2004
15 found that, while 83% of the company’s peer-reviewed papers and 80% of its internal documents
16 acknowledged the reality and human origins of climate change, 81% of its advertorials
17 communicated doubt about those conclusions.⁹⁰ Based on this “statistically significant”

1 discrepancy between internal and external communications, the authors concluded that
2 “ExxonMobil misled the public.”⁹¹

3 89. The Fossil Fuel Defendants—individually, and through API, other trade associations,
4 and various front groups—mounted a public campaign of deception in order to continue
5 wrongfully promoting and marketing their fossil fuel products, despite their own knowledge and
6 the growing national and international scientific consensus about the hazards of doing so.

7 90. In addition to casting doubt on climate science and concealing their own internal
8 research on climate change, Defendants also funded misleading studies on the economic
9 consequences of reducing fossil fuel use. Beginning in the early 1990s, API hired economic
10 consultants at Charles River Associates to conduct studies on the costs of mitigating global
11 warming, then presented the results of those studies as independent research. One such study,
12 published in 1997, found that keeping GHG emissions at 1990 levels would reduce economic
13 growth by one to three percent every year, ultimately resulting in an annual drop in gross
14 domestic product of \$105 billion in 2010, and \$460 billion in 2030. This study was widely
15 publicized, without any acknowledgment that API had funded the study. Mobil (Exxon) cited the
16 study in advertorials in *The New York Times*, API’s executive vice president William O’Keefe
17 cited the study in testimony before Congress, and a United States Senator cited the study in a
18 resolution to block any treaty that could result from the upcoming meeting on the United Nations
19 Framework Convention on Climate Change in Kyoto. One of the study’s authors has since
20 disclosed that the models used in the 1997 study (and other Charles River Associates studies
21 funded by API) ignored the benefits of reducing GHG emissions, such as avoiding warming or
22 improving air quality.⁹²

23 91. One of the key organizations formed by the Fossil Fuel Defendants to coordinate the
24 fossil fuel industry’s response to the world’s growing awareness of climate change was the

1 International Petroleum Industry Environmental Conservation Association (IPIECA). In 1988, the
2 IPIECA formed a “Working Group on Global Climate Change” chaired by Duane LeVine,
3 Exxon’s manager for science and strategy development. The Working Group also included Brian
4 Flannery from Exxon, Leonard Bernstein from Mobil, Terry Yosie from API, and representatives
5 from BP, Shell, and Texaco (Chevron). In 1990, the Working Group sent a strategy memo created
6 by LeVine to IPIECA member companies. This memo explained that, to forestall a global shift
7 away from burning fossil fuels for energy, the industry should emphasize uncertainties in climate
8 science, call for further research, and promote industry friendly policies that would leave the
9 fossil fuel business intact.⁹³

10 92. The GCC, on behalf of Defendants and other fossil fuel companies, also funded
11 deceptive advertising campaigns and distributed misleading material to generate public
12 uncertainty around the climate debate. By doing so, the GCC and Defendants sought to prevent
13 U.S. adoption of a 1997 international agreement to limit and reduce GHG emissions known as the
14 Kyoto Protocol and thereby inflate the market for fossil fuels and the revenues and profits for
15 GCC members, including Defendants, despite the leading role that the U.S. had played in
16 negotiating the Protocol.⁹⁴ The GCC’s position on climate change contradicted decades of its
17 members’ internal scientific reports by asserting that natural trends, not human combustion of
18 fossil fuels, were responsible for rising global temperatures:

19 The GCC believes that the preponderance of the evidence indicates that most, if not
20 all, of the observed warming is part of a natural warming trend which began
21 approximately 400 years ago. If there is an anthropogenic component to this
observed warming, the GCC believes that it must be very small and must be
superimposed on a much larger natural warming trend.⁹⁵

25 [content/uploads/2022/04/GCC-Paper.pdf](https://cssn.org/wp-content/uploads/2022/04/GCC-Paper.pdf) (as of June 5, 2024). Brulle notes in particular the
26 effectiveness of the GCC in opposing the Kyoto protocol: “In one final compliment, the GCC’s
effectiveness was acknowledged in a meeting with White House staff on 21 June 2001. The
27 talking points for that meeting noted that ‘POTUS rejected Kyoto, in part, based on input from
you.’” (*Id.* at p. 15.)

available at <https://www.documentcloud.org/documents/5453339-1996-GCC-Overview-and->

1 93. The GCC’s promotion of overt climate change skepticism also contravened its
2 internal assessment that such theories lacked scientific support. Despite an internal primer
3 acknowledging that various “contrarian theories” (i.e., climate change skepticism) “do not offer
4 convincing arguments against the conventional model of greenhouse gas emission-induced
5 climate change,”⁹⁶ the GCC excluded this section from the publicly released version of the
6 backgrounder,⁹⁷ and instead funded and promoted some of those same contrarian theories.
7 Between 1989 and 1998, the GCC spent \$13 million on advertisements as part of a campaign to
8 obfuscate the facts and the science relating to climate change and undermine the public’s trust in
9 climate scientists.⁹⁸ Ultimately, the GCC’s efforts “created an influential discourse of climate
10 skepticism in the U.S. that continues to be an influential political current.”⁹⁹

11 94. For example, in a 1994 report, the GCC stated that “observations have not yet
12 confirmed evidence of global warming that can be attributed to human activities,” that “[t]he
13 claim that serious impacts from climate change have occurred or will occur in the future simply
14 has not been proven,” so “there is no basis for the design of effective policy actions that would
15 eliminate the potential for climate change.”¹⁰⁰ In 1995, the GCC published a booklet called
16 “Climate Change: Your Passport to the Facts,” which stated, “While many warnings have reached
17 the popular press about the consequences of a potential man-made warming of the Earth’s

1 atmosphere during the next 100 years, there remains no scientific evidence that such a dangerous
2 warming will actually occur.”¹⁰¹

3 95. In 1997, William O’Keefe, chairman of the GCC and executive vice president of API,
4 made the following false statement in a Washington Post op-ed: “Climate scientists don’t say that
5 burning oil, gas, and coal is steadily warming the earth.”¹⁰² This statement contradicted the
6 established scientific consensus as well as Defendants’ own knowledge. Yet Defendants did
7 nothing to correct the public record, and instead continued to fund the GCC’s anti-scientific
8 climate skepticism.

9 96. In addition to publicly spreading false and misleading information about the climate
10 science consensus, the GCC also sought to undermine credible climate science from within the
11 IPCC. After becoming a reviewer of IPCC’s Second Assessment Report in 1996, the GCC used
12 its position to accuse the lead author of a key chapter in the Report of modifying the chapter’s
13 conclusions. The GCC claimed that the author, climatologist Ben Santer, had engaged in
14 “scientific cleansing” that “understate[d] uncertainties about climate change causes and
15 effects . . . to increase the apparent scientific support for attribution of changes to climate to
16 human activities.”¹⁰³ The GCC also arranged to spread the accusation among legislators,
17 reporters, and scientists, and similar accusations were published in a *Wall Street Journal* op-ed.¹⁰⁴

28

1 This effort “was widely perceived to be an attempt on the part of the GCC to undermine the
2 credibility of the IPCC.”¹⁰⁵

3 97. In the late 1990s, Defendants shifted away from openly denying anthropogenic
4 warming and toward peddling a subtler form of climate change skepticism. Defendants became
5 alarmed by the enormous legal judgments the tobacco industry then faced as a result of decades
6 spent publicly denying the health risks of smoking cigarettes; a Shell employee explained that the
7 company “didn’t want to fall into the same trap as the tobacco companies who have become
8 trapped in all their lies.”¹⁰⁶ Defendants began to shift their communications strategy, claiming
9 they had accepted climate science all along.¹⁰⁷ Several large fossil fuel companies, including BP
10 and Shell, left the GCC (although all the Fossil Fuel Defendants remained members of API).¹⁰⁸
11 At this point in time, Defendants publicly claimed to accept the reality of anthropogenic climate
12 change, while insisting that the costs of climate action were unacceptably high in light of the
13 allegedly yet-unresolved uncertainties in climate science—especially around the severity and
14 timeframe of future climate impacts. Reflecting this new strategy, API Executive Vice President
15 (and GCC chairman) William O’Keefe announced in November 1998 that “[w]e are committed to
16 being part of the solution to the climate risk and to active participation in the debate to forge a
17 clear, defensible policy.” “[T]he debate is not about action or inaction,” O’Keefe wrote, “but what
18 set of actions is consistent with our state of knowledge and economic well-being.”¹⁰⁹ Rather than
19 publicly deny the need to address climate change, Defendants’ new communications strategy
20 sought to forestall policy actions that might decrease consumption of fossil fuel products and
21 therefore threaten Defendants’ revenues and profits.

22 98. Despite their public about-face, Defendants surreptitiously continued to organize and
23 fund programs designed to deceive the public about the weight and veracity of the climate science

¹⁰⁸ *Ibid.*

¹⁰⁹ API, *U.S. Oil Industry Recognizes Climate Change Risk*, 28 *Oil & Gas Journal* (Nov. 1, 1998).

1 consensus. In 1998, API convened a Global Climate Science Communications Team (GCSCT)
2 whose members included Exxon’s senior environmental lobbyist, an API public relations
3 representative, and a federal relations representative from Chevron. There were no climate
4 scientists on the GCSCT. Steve Milloy and his organization, The Advancement of Sound Science
5 Coalition (TASSC), were founding members of the GCSCT. TASSC was an organization created
6 by the tobacco industry to give the impression of a “grassroots” movement, which aimed to sow
7 uncertainty by discrediting the scientific link between exposure to second-hand cigarette smoke
8 and increased rates of cancer and heart disease. Philip Morris had launched TASSC on the advice
9 of its public relations firm, which advised Philip Morris that the tobacco company itself would
10 not be a credible voice on the issue of smoking and public health. TASSC also became a front
11 group for the fossil fuel industry, using the same tactics it had honed while operating on behalf of
12 tobacco companies to spread doubt about climate science.

13 99. The GCSCT continued Defendants’ efforts to deceive the public about the dangers of
14 fossil fuel use by launching a campaign in 1998 to convince the public that the scientific basis for
15 climate change was in doubt. The multi-million-dollar, multi-year “Global Climate Science
16 Communications Action Plan” plan, sought, among other things, to do the following: (a)
17 “[d]evelop and implement a national media relations program to inform the media about
18 uncertainties in climate science”; (b) “generate national, regional and local media coverage on the
19 scientific uncertainties”; (c) “[d]evelop a global climate science information kit for media
20 including peer-reviewed papers that undercut the ‘conventional wisdom’ on climate science”; (d)
21 “[p]roduce . . . a steady stream of op-ed columns”; and (e) “[d]evelop and implement a direct
22 outreach program to inform and educate members of Congress, state officials, . . . and school
23 teachers/students about uncertainties in climate science” to “begin to erect a barrier against
24 further efforts to impose Kyoto [Protocol]-like measures in the future”¹¹⁰—a blatant attempt to
25 disrupt international efforts to negotiate any treaty curbing GHG emissions and to ensure a

plan.pdf](https://assets.documentcloud.org/documents/784572/api-global-climate-science-communications-plan.pdf) (as of June 5, 2024).

1 continued and unimpeded market for, and profits from, Fossil Fuel Defendants' fossil fuel
2 products.

3 100. Exxon, Chevron, and API directed and contributed to the development of the plan,
4 which plainly set forth the criteria by which the contributors would know when their efforts to
5 manufacture doubt had been successful. "Victory," they wrote, "will be achieved when . . .
6 average citizens 'understand' (recognize) uncertainties in climate science" and "recognition of
7 uncertainties becomes part of the 'conventional wisdom.'"¹¹¹ In other words, the plan was part of
8 Defendants' goal to use disinformation to plant doubt about the reality of climate change in an
9 effort to maintain consumer demand for their fossil fuel products and their large profits.

10 101. Soon after, API distributed a memo to its members illuminating API's and the Fossil
11 Fuel Defendants' concern over the potential regulation of their fossil fuel products: "Climate is at
12 the center of the industry's business interests. Policies limiting carbon emissions reduce
13 petroleum product use. That is why it is API's highest priority issue and defined as 'strategic.'"¹¹²
14 The API memo stressed many of the strategies that Defendants collectively utilized to combat the
15 perception of fossil fuel products as hazardous. These strategies included the following:

16 a. Influencing the tenor of the climate change "debate" as a means to establish that
17 greenhouse gas reduction policies like the Kyoto Protocol were not necessary to responsibly
18 address climate change;

19 b. Maintaining strong working relationships between government regulators on
20 the one hand, and, on the other, communications-oriented organizations and other groups carrying
21 Defendants' message minimizing the hazards of the unabated use of fossil fuel products and
22 opposing regulation thereof; and

23 c. Presenting Defendants' positions on climate change in domestic and
24 international forums, including by presenting an "alternative" to the IPCC.

25 _____
26 ¹¹¹ *Ibid.*

27 ¹¹² Allegations of Political Interference with Government Climate Change Science,
28 Hearing Before the Comm. on Oversight and Government Reform, 110th Cong. 324 (Mar. 19,
2007), available at <https://www.govinfo.gov/content/pkg/CHRG-110hhr37415/html/CHRG-110hhr37415.htm> (as of June 5, 2024).

1 102. In furtherance of the strategies described in these memoranda, Defendants made
2 misleading statements about climate change, the relationship between climate change and fossil
3 fuel products, and the urgency of the problem. Defendants made these statements in public fora
4 and in advertisements published in newspapers and other media with substantial circulation in
5 California, including national publications such as *The New York Times*, *The Wall Street Journal*,
6 and *The Washington Post*.

7 103. Another key strategy in Defendants' efforts to discredit the scientific consensus on
8 climate change as well as the IPCC itself was to fund scientists who held fringe opinions. Those
9 scientists obtained part or all of their research budget from the Fossil Fuel Defendants, either
10 directly or through Fossil Fuel Defendant-funded organizations like API,¹¹³ but frequently failed
11 to disclose their funding sources.¹¹⁴ At least one such scientist, Dr. Wei-Hock Soon, took the
12 highly unusual approach of contractually agreeing to allow donors to review his research before
13 publication, and his housing institution, the Smithsonian Institute, agreed not to disclose the
14 funding arrangement without prior permission from his fossil fuel donors.¹¹⁵ Defendants intended
15 for the research of scientists they funded to be distributed to and relied on by consumers when
16 buying Fossil Fuel Defendants' products, including by consumers in California.

17 104. Creating a false perception of disagreement in the scientific community (despite the
18 consensus previously acknowledged within the industry) has evidently disrupted vital channels of
19 communication between scientists and the public. A 2007 Yale University-Gallup poll found that
20 while 71% of Americans personally believed global warming was happening, only 48% believed
21 that there was a consensus among the scientific community, and 40% believed, falsely, that there

27 <https://www.ucsusa.org/sites/default/files/attach/2015/07/The-Climate-Deception-Dossiers.pdf>
28 (as of June 5, 2024).

1 was substantial disagreement among scientists over whether global warming was occurring.¹¹⁶
2 Eight years later, a 2015 Yale-George Mason University poll found that “[o]nly about one in ten
3 Americans understands that nearly all climate scientists (over 90%) are convinced that human-
4 caused global warming is happening, and just half . . . believe a majority do.”¹¹⁷ Further, it found
5 that 33% of Americans believe that climate change is mostly due to natural changes in the
6 environment, in stark contrast to the 97% of peer-reviewed climate science papers that
7 acknowledge that global warming is happening and at least partly human-caused.¹¹⁸ The lack of
8 progress, and indeed the regression, in the public’s understanding of climate science over this
9 period—during which Defendants professed to accept the conclusions of mainstream climate
10 science while at the same time promoting a false, contradictory narrative—demonstrates the
11 success of Defendants’ deception campaign in thwarting the dissemination of accurate scientific
12 information to the public regarding the effects of the use of fossil fuels.

13 105. Defendants, individually, collectively, and through their trade association
14 memberships, worked directly, and often in a deliberately obscured manner, to conceal and
15 misrepresent fossil fuel products’ known dangers from consumers, the public, and the State.

16 106. Defendants have funded dozens of think tanks, front groups, and “dark money”
17 foundations—i.e., organizations that raise funds to influence elections while concealing their
18 contributions to political candidates or causes, and the sources of their contributions—promoting
19 climate change denial. These organizations include the Competitive Enterprise Institute, the
20 Heartland Institute, Frontiers of Freedom, Committee for a Constructive Tomorrow, and the
21 Heritage Foundation. According to the Union of Concerned Scientists, from 1998 to 2017, Exxon
22 spent over \$36 million funding numerous organizations misrepresenting the scientific

2024).

¹¹⁸ *Ibid.*

1 consensus¹¹⁹ that fossil fuel products were causing climate change, sea level rise, and injuries to
2 California, among other communities. Several Defendants have been linked to other groups that
3 undermine the scientific basis linking fossil fuel products to climate change and sea level rise,
4 including the Frontiers of Freedom Institute and the George C. Marshall Institute.

5 107. Beginning in 2015, journalists began to uncover mounting evidence of Defendants'
6 campaign of deception. In September 2015, journalists at *Inside Climate News* reported that, as
7 far back as the 1970s, Exxon had had sophisticated knowledge of the causes and consequences of
8 climate change and of the role its products played in contributing to climate change.¹²⁰

9 108. Between October and December 2015, several journalists at the Energy and
10 Environment Reporting Project at Columbia University's Graduate School of Journalism and the
11 *Los Angeles Times* also exposed the fact that, as far back as the 1970s, Exxon and other members
12 of the fossil fuel industry had had superior knowledge of the causes and consequences of climate
13 change and the role their products played in causing it.¹²¹

14 109. In November 2017, the Center for International Environmental Law issued a report
15 revealing that Defendants, including API, had had superior knowledge of the causes and
16 consequences of climate change and the role fossil fuel products played in causing it as early as
17 the 1970s.¹²²

1 **D. Defendants Could Have Chosen to Facilitate, and Be Part of, a Lower-**
2 **Carbon Future, but Instead Chose Corporate Profits and Continued**
3 **Deception**

4 110. Defendants could have chosen a different path. Defendants could have refrained from
5 undermining the global effort to mitigate the impacts of GHG emissions, or contributed to it by,
6 for example, delineating practical technical strategies, policy goals, and regulatory structures that
7 would have allowed them to continue their business ventures while reducing GHG emissions and
8 supporting a transition to a lower-carbon future. Defendants' own internal documents from as
9 early as the 1970s detailed alternative low-carbon pathways that would reduce GHG emissions by
10 reducing fossil fuel production and use, and developing non-fossil energy sources. Instead,
11 Defendants devoted significant efforts to deceiving consumers, lawmakers, and the public about
12 the existential hazards of burning fossil fuels—all with the purpose and effect of perpetuating and
13 inflating usage of fossil fuels, and therefore Defendants' revenues and profits, and delaying the
14 advent of alternative energy sources not based on fossil fuels.

15 111. As a result of Defendants' tortious, deceptive, and misleading conduct, consumers of
16 Defendants' fossil fuel products, the public, and policymakers, in California as elsewhere, have
17 been deliberately and unnecessarily deceived about the following: the role of fossil fuel products
18 in causing global warming, sea level rise, disruptions to the hydrologic cycle, more extreme
19 precipitation, heat waves, droughts, and other consequences of the climate crisis; the acceleration
20 of global warming since the mid-twentieth century; and the fact that continued increases in fossil
21 fuel consumption create increasingly severe environmental threats and increasingly significant
22 economic costs for coastal and other communities in California. Consumers, the public, and
23 policymakers in California and elsewhere have also been deceived about the depth and breadth of
24 the state of the scientific evidence on anthropogenic climate change, and, in particular, about the
25 strength of the scientific consensus regarding the role of fossil fuels in causing both climate
26 change and a wide range of potentially destructive impacts.

27 112. Defendants' deception also significantly delayed the transition to alternative energy
28 sources that could have prevented some of the worst impacts of climate change in California.

1 Exxon had long forecasted—and other Defendants were aware—that alternative energy sources
2 could have penetrated half of a competitive energy market in 50 years if allowed to develop
3 unimpeded. However, by sowing doubt about the future consequences of unrestricted fossil fuel
4 consumption, Defendants’ deception campaign successfully forestalled development and
5 dissemination of alternative fuels, as well as legislation supporting a broad-based transition to
6 alternative energy sources. This delay resulted in tremendous revenues and profits to Defendants,
7 and led to emission of huge amounts of avoidable greenhouse gases, thereby ensuring that the
8 damage caused by climate change will be substantially more severe than if Defendants had acted
9 in a manner commensurate with their internal knowledge of climate risks.

10 **E. Defendants’ Internal Actions Demonstrate Their Awareness of the Impacts**
11 **of Climate Change and Their Intent to Continue to Profit from the**
12 **Unabated Use of Fossil Fuel Products**

13 113. In contrast to their public-facing efforts challenging the validity of the scientific
14 consensus about anthropogenic climate change, the Fossil Fuel Defendants’ acts and omissions
15 since the 1970s—including taking expensive actions to protect their own investments from the
16 impacts of climate change—have evinced their clear understanding of the realities of climate
17 change and its likely consequences. These actions have included making multi-billion-dollar
18 infrastructure investments for their own operations, including, among others, the following:
19 raising offshore oil platforms to protect against sea level rise; reinforcing offshore oil platforms to
20 withstand increased wave strength and storm severity; and developing technology and
21 infrastructure to extract, store, and transport fossil fuels in a warming Arctic environment.¹²³

22 114. For example, oil and gas reserves in the Arctic that were not previously reachable due
23 to sea ice are becoming increasingly reachable as sea ice thins and melts due to climate change.¹²⁴
24 In 1973, Exxon obtained a patent for a cargo vessel, such as a tank ship, capable of breaking

development/](https://www.oxfordenergy.org/publications/the-prospects-and-challenges-for-arctic-oil-development/) (as of June 5, 2024).

1 through sea ice for use in Arctic operations¹²⁵ and for an oil tanker¹²⁶ designed for Arctic
2 operations.

3 115. Similarly, in 1974, Texaco (Chevron) obtained a patent for a mobile Arctic drilling
4 platform designed to withstand significant interference from lateral ice masses.¹²⁷

5 116. Shell obtained a patent for an Arctic offshore platform adapted for conducting
6 operations in the Beaufort Sea in 1984.¹²⁸

7 117. In 1989, Norske Shell, Royal Dutch Shell’s Norwegian subsidiary, altered designs for
8 a natural gas platform planned for construction in the North Sea to account for anticipated sea
9 level rise. Those design changes added substantial costs to the project.¹²⁹

10 a. In 1979, Norske Shell was approved by Norwegian oil and gas regulators to
11 operate a portion of the Troll oil and gas field.

12 b. In 1986, the Norwegian parliament granted Norske Shell authority to complete
13 the first development phase of the Troll field gas deposits, and Norske Shell began designing the
14 “Troll A” gas platform, with the intent to begin operation of the platform in approximately 1995.
15 Based on the very large size of the gas deposits in the Troll field, the Troll A platform was
16 projected to operate for approximately 70 years.

17 c. The platform was originally designed to stand approximately 100 feet above sea
18 level—the height necessary to stay above the waves in a once-in-a-century-strength storm.

1 d. In 1989, Shell engineers revised their plans to increase the above-water height
2 of the platform by three to six feet in order to account for higher anticipated average sea levels
3 and increased storm intensities due to global warming over the platform's 70-year operational
4 life.¹³⁰

5 e. Shell projected that the additional three to six feet of above-water construction
6 would increase the cost of the Troll A platform by tens of millions of dollars.

7 **F. Defendants' Actions Have Slowed the Development of Alternative Energy**
8 **Sources and Exacerbated the Costs of Adapting to and Mitigating the**
9 **Adverse Impacts of the Climate Crisis**

10 118. As GHG pollution accumulates in the atmosphere, some of which (namely CO₂) does
11 not dissipate for potentially thousands of years, climate changes and consequent adverse
12 environmental changes compound, and their frequencies and magnitudes increase. As those
13 adverse environmental changes compound, and their frequencies and magnitudes increase, so too
14 do the physical, environmental, economic, and social injuries resulting therefrom.

15 119. Delayed societal development and adoption of alternative energy sources and related
16 efforts to curb anthropogenic GHG emissions have therefore increased environmental harms and
17 increased the magnitude and cost to address harms, including to California, that have already
18 occurred or are locked in as a result of historical emissions.

19 120. Therefore, Defendants' campaign to obscure the science of climate change to protect
20 and expand the use of fossil fuels greatly increased and continues to increase the injuries suffered
21 by California and its residents. Had concerted action to reduce GHG emissions begun earlier, the
22 subsequent impacts of climate change could have been avoided or mitigated.

23 121. Defendants have been aware for decades that clean energy presents a feasible
24 alternative to fossil fuels. In 1980, Exxon forecasted that non-fossil fuel energy sources, if
25 pursued, could penetrate half of a competitive energy market in approximately 50 years.¹³¹ This
26 internal estimate was based on extensive modeling within the academic community, including

27 ¹³⁰ *Ibid.*

28 ¹³¹ Shaw and McCall, Exxon Research and Engineering Company's Technological
Forecast: CO₂ Greenhouse Effect (Dec. 18, 1980) p. 5, available at
<https://www.climatefiles.com/exxonmobil/1980-exxon-memo-on-the-co2-greenhouse-effect-and-current-programs-studying-the-issue/> (as of June 5, 2024).

1 research conducted by the Massachusetts Institute of Technology’s David Rose, which concluded
2 that a transition to non-fossil energy could be achieved in around 50 years. Exxon circulated an
3 internal memo approving of Rose’s conclusions, stating they were “based on reasonable
4 assumptions.”¹³² But instead of pursuing a clean energy transition or warning the public about the
5 dangers of burning fossil fuels, Defendants chose to deceive consumers to preserve Fossil Fuel
6 Defendants’ profits and assets. As a result, much time has been lost in which consumers and
7 policymakers could have done much to mitigate the climate crisis in California.

8 122. The costs of inaction on anthropogenic climate change and its adverse environmental
9 effects were not lost on Defendants. In a 1997 speech by John Browne, Group Chief Executive
10 for BP America, at Stanford University, Browne described Defendants’ and the entire fossil fuel
11 industry’s responsibility and opportunity to reduce the use of fossil fuel products, reduce global
12 CO₂ emissions, and mitigate the harms associated with the use and consumption of such products:

13 [W]e need to go beyond analysis and to take action. It is a moment for change and
14 for a rethinking of corporate responsibility.

15

16 [T]here is now an effective consensus among the world’s leading scientists and
17 serious and well informed people outside the scientific community that there is a
18 discernible human influence on the climate, and a link between the concentration
19 of carbon dioxide and the increase in temperature.

20

21 We [the fossil fuel industry] have a responsibility to act, and I hope that through
22 our actions we can contribute to the much wider process which is desirable and
23 necessary.

24 BP accepts that responsibility and we’re therefore taking some specific steps.

25 To control our own emissions.

26 To fund continuing scientific research.

27 To take initiatives for joint implementation.

28 To develop alternative fuels for the long term.

And to contribute to the public policy debate in search of the wider global answers
to the problem.¹³³

to-stanford](https://www.climatefiles.com/bp/bp-climate-change-speech-to-stanford) (as of June 5, 2024).

1 123. Despite Defendants’ knowledge of the foreseeable, measurable, and significant harms
2 associated with the unrestrained consumption and use of fossil fuel products, in California as
3 elsewhere, and despite Defendants’ knowledge of technologies and practices that could have
4 helped to reduce the foreseeable dangers associated with their fossil fuel products, Defendants
5 continued to promote heavy fossil fuel use, and mounted a campaign to obscure the connection
6 between fossil fuel products and the climate crisis, thus dramatically adding to the costs of
7 abatement. (See *supra*, Section IV.C.) This campaign was intended to, and did, reach and
8 influence California consumers, along with consumers elsewhere.

9 124. At all relevant times, Defendants were deeply familiar with opportunities to reduce
10 the use of fossil fuel products and associated GHG emissions, mitigate the harms associated with
11 the use and consumption of these products, and promote development of alternative, clean energy
12 sources. Examples of that recognition date back to the 1960s, and include, but are not limited to,
13 the following:

14 a. In 1980, Imperial Oil (Exxon) wrote in its “Review of Environmental
15 Protection Activities for 1978–79”: “There is no doubt that increases in fossil fuel usage and
16 decreases in forest cover are aggravating the potential problem of increased CO₂ in the
17 atmosphere. Technology exists to remove CO₂ from stack gases but removal of only 50% of the
18 CO₂ would double the cost of power generation.”¹³⁴

19 b. A 1987 company briefing produced by Shell on “Synthetic Fuels and
20 Renewable Energy” emphasized the importance of immediate research and development of
21 alternative fuel sources, noting that “the task of replacing oil resources is likely to become
22 increasingly difficult and expensive and there will be a growing need to develop clean,
23 convenient alternatives. . . . New energy sources take decades to make a major global
24 contribution. Sustained commitment is therefore needed during the remainder of this century to
25

26 _____
27 ¹³⁴ Imperial Oil Ltd., Review of Environmental Protection Activities for 1978–1979 (Aug.
28 6, 1980) p. 2, available at <https://www.climatefiles.com/exxonmobil/1980-imperial-oil-review-of-environmental-protection-activities-for-1978-1979/> (as of June 5, 2024).

1 ensure that new technologies and those currently at a relatively early stage of development are
2 available to meet energy needs in the next century.”¹³⁵

3 c. A 1989 article in a publication from Exxon Corporate Research for company
4 use only stated: “CO₂ emissions contribute about half the forcing leading to a potential
5 enhancement of the Greenhouse Effect. Since energy generation from fossil fuels dominates
6 modern CO₂ emissions, strategies to limit CO₂ growth focus near term on energy efficiency and
7 long term on developing alternative energy sources. Practiced at a level to significantly reduce the
8 growth of greenhouse gases, these actions would have substantial impact on society and our
9 industry—near-term from reduced demand for current products, long term from transition to
10 entirely new energy systems.”¹³⁶

11 125. Despite these repeated recognitions of opportunities to reduce emissions and mitigate
12 corresponding harms from climate change, Defendants continued to sow doubt and
13 disinformation in the minds of the public regarding the causes and effects of climate change, and
14 methods of reducing emissions. Examples of those efforts include, but are not limited to, the
15 following:

16 a. In 1996, more than 30 years after API’s president told petroleum industry
17 leaders that carbon emissions from fossil fuels could “cause marked changes in climate” by the
18 year 2000 if not abated,¹³⁷ API published the book *Reinventing Energy: Making the Right*
19 *Choices* to refute this very conclusion. Contradicting the scientific consensus of which its
20 members had been aware for decades, the book claims: “Currently, **no** conclusive—or even
21 strongly suggestive—scientific evidence exists that human activities are significantly affecting
22 sea levels, rainfall, surface temperatures, or the intensity and frequency of storms.”¹³⁸ The book

26 Engineering Company (Fall 1989), available at <https://www.climatefiles.com/exxonmobil/1989-exxon-mobil-article-technologys-place-marketing-mix/> (as of June 5, 2024).

27 ¹³⁷ Ikard, *Meeting the Challenges of 1966*, in Proceedings of the American Petroleum
28 Institute (1965) p. 13, available at <https://www.documentcloud.org/documents/5348130-1965-API-Proceedings> (as of June 5, 2024).

¹³⁸ American Petroleum Institute, *Reinventing Energy: Making the Right Choices* (1996)

1 also suggested that even if some warming does occur, such warming “would present few if any
2 problems” because, for example, farmers could be “smart enough to change their crop plans” and
3 low-lying areas would “likely adapt” to sea level rise.¹³⁹

4 b. In the publication, API also contended that “[t]he state of the environment does
5 not justify the call for the radical lifestyle changes Americans would have to make to substantially
6 reduce the use of oil and other fossil fuels” and that the “benefits of alternatives aren’t worth the
7 cost of forcing their use.” “Some jobs definitely will be created in making, distributing and selling
8 alternatives. But they will come at the expense of lost jobs in the traditional automobile and
9 petroleum industries,” the authors continued. “[A]lternatives will likely be more expensive than
10 conventional fuel/vehicle technology. Consumers, obviously, will bear these increased expenses,
11 which means they will have less to spend on other products. This in turn will . . . cost jobs.”¹⁴⁰

12 c. API published this book to ensure its members could continue to produce and
13 sell fossil fuels in massive quantities that it knew would devastate the planet. The book’s final
14 section reveals this purpose. API concluded: “[S]evere reductions in greenhouse gas emissions by
15 the United States, or even all developed countries, would impose large costs on those countries
16 but yield little in the way of benefits—even under drastic climate change scenarios.”¹⁴¹

17 d. From at least 2005 to 2016, Exxon executives strategized in internal
18 communications about how to diminish concerns about climate change and muddle scientific
19 findings that might hurt the company’s fossil fuel business.¹⁴²

20 126. The Fossil Fuel Defendants could have made major inroads towards mitigating the
21 harms they caused, and in particular, the State’s injuries, by developing and employing
22 technologies to capture and sequester GHG emissions associated with conventional use of their
23

¹⁴² Matthews and Eaton, *Inside Exxon’s Strategy to Downplay Climate Change*, Wall Street Journal (Sept. 14, 2023), available at <https://www.wsj.com/business/energy-oil/exxon-climate-change-documents-e2e9e6af> (as of June 5, 2024).

1 fossil fuel products. The Fossil Fuel Defendants had knowledge of these technologies dating back
2 at least to the 1960s, and, had indeed, internally researched many such technologies.

3 127. Even if the Fossil Fuel Defendants did not adopt technological or energy source
4 alternatives that would have reduced the use of fossil fuel products, reduced global GHG
5 pollution, and/or mitigated the harms associated with the use and consumption of such products,
6 the Fossil Fuel Defendants could have taken other practical, cost-effective steps to mitigate the
7 harms caused by their fossil fuel products. Those alternatives could have included, among other
8 measures, the following:

9 a. Refraining from affirmative efforts, whether directly, through coalitions, or
10 through front groups, to distort public debate, manipulate public perception and the public policy
11 agenda, and cause many consumers, business, and political leaders to think the relevant science is
12 far less certain than it actually is;

13 b. Acknowledging the validity of scientific evidence on anthropogenic climate
14 change and the damages it will cause people, communities (including the State), and the
15 environment. Disseminating that evidence would have changed the public policy agenda from
16 determining whether to combat climate change to deciding how to combat it; avoided much of the
17 public confusion that has ensued since at least 1988; and contributed to an earlier and quicker
18 transition to cleaner energy sources in California that could help minimize catastrophic climatic
19 consequences;

20 c. Forthrightly communicating with consumers, the public, regulators,
21 shareholders, banks, insurers, and the State, and warning them about the global warming hazards
22 of fossil fuel products that were known to Defendants, which would have enabled those groups to
23 make informed decisions about whether to curb the use of these products—including whether and
24 to what extent to invest in alternative clean energy sources instead of in fossil fuels;

25 d. Sharing their internal scientific research with consumers, lawmakers, and the
26 public, as well as with other scientists and business leaders, to increase public understanding of
27 the scientific underpinnings of climate change and its relation to fossil fuel products;
28

1 e. Supporting and encouraging policies to avert catastrophic climate change, and
2 demonstrating corporate leadership in addressing the challenges of transitioning to a low-carbon
3 economy; and

4 f. Prioritizing development of alternative sources of energy through sustained
5 investment and research on renewable energy sources to replace dependence on hazardous fossil
6 fuel products.

7 128. Despite their knowledge of the foreseeable harms associated with the consumption of
8 fossil fuel products, and despite the existence of, and the fossil fuel industry's knowledge of,
9 opportunities to reduce the foreseeable dangers associated with those products, Defendants
10 wrongfully promoted and concealed the hazards of using fossil fuel products, delaying
11 meaningful development of alternative energy sources and exacerbating the costs of adapting to
12 and mitigating the adverse impacts of the climate crisis, including the climate crisis in California.

13 **G. Defendants Continue to Deceive California Consumers Through**
14 **Misleading Advertisements That Portray Defendants as Climate-Friendly**
15 **Energy Companies and Obscure Their Role in Causing Climate Change**

16 129. Defendants' deceptive conduct continues to the present day, albeit through updated
17 messaging. Now, rather than engaging in outright denials of the existence of climate change,
18 Defendants deflect attention from their role in causing climate change by falsely portraying fossil
19 fuel products and companies as environmentally friendly, climate-friendly, or otherwise less
20 environmentally damaging than those products and companies really are.

21 130. Defendants have continued to mislead the public about the impact of fossil fuel
22 products on climate change through "greenwashing." Through recent advertising campaigns and
23 public statements in California and/or intended to reach California, including but not limited to
24 online advertisements and social media posts, Defendants falsely and misleadingly portray these
25 products as "green," and the Fossil Fuel Defendants portray themselves as climate-friendly
26 energy companies that are deeply engaged in finding solutions to climate change. In reality,
27 Fossil Fuel Defendants continue to primarily invest in, develop, promote, and profit from fossil
28 fuel products and heavily market those products to consumers, with full knowledge that those
products will continue to exacerbate climate change harms.

1 131. Defendants’ greenwashing exploits California consumers’ concerns about climate
2 change and their desire to purchase “green” products and spend their consumer dollars on
3 products and businesses that are taking substantial and effective measures to combat climate
4 change. Defendants’ false advertisements are likely to mislead California consumers by giving
5 the impression that in purchasing the Fossil Fuel Defendants’ fossil fuel products, consumers are
6 supporting genuine, substantial, and effective measures to mitigate climate change through these
7 companies’ alleged investments in clean energy. Defendants’ greenwashing ultimately attempts to
8 persuade California consumers to support Defendants’ purported attempts to contribute to climate
9 change solutions by purchasing and consuming these products, including the Fossil Fuel
10 Defendants’ fossil fuel products, thereby contributing to Defendants’ revenues and profits by
11 misleading consumers.

12 132. Below are representative examples of Defendants’ greenwashing campaigns.

13 **1. Defendants’ Affirmative Promotion of Fossil Fuel Products as**
14 **“Green,” “Clean,” or Otherwise Good for the Environment Is Likely**
15 **to Mislead California Consumers About How Use of Those Fossil**
 Fuel Products Leads to Climate Change

16 133. At all times relevant to this complaint, Defendants have promoted certain of the
17 Fossil Fuel Defendants’ fossil fuel products as environmentally beneficial, when in fact those
18 products continue to contribute to climate change, and thus imperil the environment, if used as
19 intended. These products, which Defendants tout as “green,” “clean” and/or “cleaner,” and/or
20 “environmentally friendly,” in fact result in the increase of GHG emissions, despite Defendants’
21 knowledge that, when used as designed and intended, these products lead to climate change.

22 134. Defendants’ advertisements capitalize on California consumers’ concern over
23 environmental degradation. Because of a growing collective realization of past environmental
24 damage and increasingly severe current and anticipated future climate change harms, consumers
25 more often seek to buy products that they believe will not contribute to further injury to the
26 environment. By portraying fossil fuel products as environmentally friendly, and with words,
27 phrases, colors, and imagery that evoke positive environmental attributes, these advertisements
28 present fossil fuel products as beneficial to the environment. Reasonable consumers are likely to

1 be misled by Defendants’ advertisements into believing that these products do not contribute to
2 substantial injury to the environment. However, these supposedly environmentally friendly fossil
3 fuel products, through increased GHG emissions, contribute to the sweeping environmental
4 degradation caused by climate change—just as other fossil fuel products do. By promoting fossil
5 fuel products as environmentally beneficial, Defendants exploit concerned consumers’ goodwill
6 and mislead them into purchasing products that they believe will be part of the solution, even
7 though Defendants are aware that these products only exacerbate the problem.

8 135. Defendants’ marketing of fossil fuel products as environmentally beneficial follows
9 in the footsteps of the tobacco industry’s advertising campaigns to de-emphasize, and confuse the
10 public about, the deadly effects of smoking cigarettes. Just as tobacco companies promoted “low-
11 tar” and “light” cigarettes, inducing consumers to think of them as healthy alternatives to quitting
12 smoking, while knowing that smoking “healthy” cigarettes was still harmful to human health, so
13 too do Defendants peddle “low-carbon” and “emissions-reducing” fossil fuel products to persuade
14 consumers that those products are climate-friendly alternatives to traditional fossil fuels. In
15 reality, the fossil fuel products they describe as “low-carbon,” “clean” and/or “cleaner,” “green,”
16 and “emissions-reducing” in fact contribute to climate change and are harmful to the health of the
17 planet and its people.

18 136. Below are representative examples of the Fossil Fuel Defendants’ advertisements to
19 California consumers that misleadingly portray fossil fuels as environmentally beneficial or
20 benign and fail to mention the products’ role in causing environmentally injurious climate
21 change. The emphasis on lower emissions, “cleaning” terminology, and positive environmental
22 imagery and messaging—individually and together—in Defendants’ advertisements are likely to
23 mislead reasonable consumers by suggesting that Defendants’ fuels are environmentally
24 beneficial or benign when they contribute to climate change like any other fossil fuel product.
25 The examples are representative of Defendants’ other advertisements and public statements in
26 Defendants’ greater greenwashing strategy to confuse consumers about the consequences of using
27 fossil fuel products and consequently to increase demand for—and profits from—those fossil fuel
28 products.

1 a. Since at least 2016, Exxon has offered for sale and marketed its Synergy fossil
2 fuels, including, since at least 2020, at a substantial number of Exxon-branded gas stations in
3 California. In Exxon’s advertisements for its Synergy fuels, including those on or near the gas
4 pumps at Exxon-branded gas stations in California, Exxon makes several claims that a reasonable
5 consumer would understand to mean that the Synergy fuels are beneficial or benign, and not
6 harmful, to the environment. For example, Exxon consistently promotes Synergy fuels as “clean”
7 or “cleaner,” and the company’s climate strategy mentions its Synergy fuel, claiming it can help
8 reduce GHG emissions. Exxon also cites Synergy’s alleged reduction of CO₂ emissions in
9 Exxon’s advertisement of the company’s improved environmental performance. An
10 advertisement on Exxon’s website, which is reproduced on the following page, includes an image
11 featuring a bright sunrise in a clear sky over hills of green grass, green trees, and little to no
12 industrial or urban development.

3  **Important Additional Information Regarding Proxy Solicitation:**

7 *Conscientious practices. Rigorous standards.*

8 Continually improving environmental performance while pursuing reliable and affordable energy

9 Ten years ago, we introduced *Protect Tomorrow. Today.* – a set of expectations that serves as the foundation for our environmental performance. Guided by a scientific understanding of the environmental impacts and related risks of our operations, these rigorous standards and good practices have become an integral part of our day-to-day operations in every country in which we do business including those with minimal regulations in place.

10 As well, we consider the long-term social and economic needs of the communities in which we work and continually engage stakeholders in the process.

11 The following are the three major areas in which we've concentrated our efforts to reduce environmental impacts.

12 **Improve the efficiency of our operations**

13 ExxonMobil invested more than \$1.5 billion over the last six years to improve efficiency and reduce greenhouse gas emissions from our operating facilities, such as refineries and chemical plants. In the past ten years we have reduced greenhouse gas emissions in our operations by more than 7 million metric tons, which is the equivalent of taking about 1.4 million cars off the road.

14 **Improve efficiency in consumer use of fuels**

15 We're continually innovating to develop products that enable customers to reduce their energy use and CO2 emissions. For example, we have:

- 16 • Developed specially formulated synthetic lubricants for cars, trucks and industrial equipment that last longer and help end-users reduce their energy consumption
- 17 • Created tire liners that retain air better than their predecessors, thereby improving vehicle fuel efficiency
- 18 • Developed a technology to improve the separator films used in lithium-ion batteries, which are used in laptops, cell phones and, increasingly, hybrid vehicles
- 19 • Engineered Fuel Technology Synergy™ fuels to help improve fuel economy and reduce CO2 emissions**

20 **Figure 7: ExxonMobil Fuels “Environmental Performance” website**

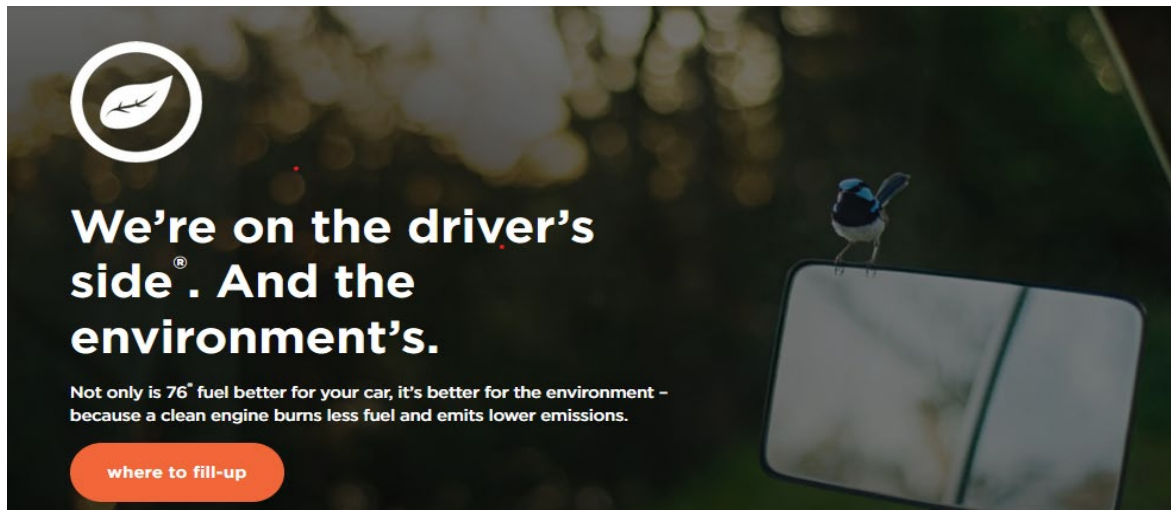

21 b. In addition to its Synergy fuels, Exxon offers for sale, and has marketed, Mobil
22 1™ ESP x2 motor oil to California consumers. From 2016 through at least 2022, Exxon promoted
23 Mobil 1™ ESP x2 on the website *Energy Factor*—effectively a corporate blog for Exxon, in
24 which Exxon claims to discuss developing safe and reliable energy sources for the future—in a
25 post titled, “Green motor oil? ExxonMobil scientists deliver an unexpected solution.” According
26 to its advertisement of Mobil 1™ ESP x2, Exxon specially formulated the green oil to “contribute
27 to [] carbon-emission reduction efforts.” Exxon’s advertising suggests to the consumer that
28

1 purchase and use of this motor oil conveys an environmental benefit, when in fact the opposite is
2 true.

3 c. Shell also offers for sale and markets in California gasoline and oil products.
4 Shell describes its products as “cleaning” and that their use “produces fewer emissions.” Shell’s
5 repeated claim that its products are clean, and its frequent use of green and environmentally
6 positive imagery in its marketing materials, individually and together, are likely to mislead
7 reasonable consumers into believing that Shell’s fuels are environmentally beneficial or benign,
8 when in fact they are fossil fuels which, when used as designed and intended, contribute to
9 climate change.

10 d. Similarly, Chevron’s gasoline offered for sale and marketed in California,
11 Chevron with Techron, is marketed as having “cleaning power” that minimizes emissions.
12 Chevron’s repeated emphasis on “cleaning” terminology, its focus in its marketing materials on
13 “advancing a lower carbon future” and “ever-cleaner” energy, and its express solicitation of
14 consumers who “care for the environment” are all likely to mislead reasonable consumers by
15 suggesting that Chevron’s fuels are environmentally beneficial or benign, when they are not.

16 e. Phillips 66, through its 76-branded gas stations in California, offers for sale and
17 markets its 76-brand fossil fuels. In Phillips 66’s advertisements for its 76-brand fuels, including
18 advertisements on or near the pumps at 76-branded gas stations in California, Phillips 66 claims
19 that its fuels “clean” a car’s engine, resulting in “lower emissions, and that deposits left from
20 other gasolines “can increase emissions.” Phillips 66 advertises that 76’s fossil fuels are “better
21 for the environment.” The 76 website for 76’s fuels contains the marketing materials shown
22 below, in which Phillips 66 makes the claim—superimposed on an image of a bluebird standing
23 on a car’s side mirror and looking at the viewer, with silhouetted trees in the background—that 76
24 and its fossil fuels align with the values of environmentally conscious consumers: “We’re on the
25 driver’s side®. And the environment’s.”
26
27
28

9 **Figure 8: Phillips 66, 76 Fuels Website: Top Tier Gas**

10 137. The Fossil Fuel Defendants also collectively promote their petroleum and natural gas
11 products through Defendant API, which makes public statements and claims about oil and natural
12 gas. These include advertisements and promotional campaign websites that have been directed at
13 and/or reached California, which reasonable consumers would understand to mean that the Fossil
14 Fuel Defendants' fossil fuels are beneficial or benign, not harmful, to the environment. In
15 particular, API's marketing material falsely promotes the narrative that natural gas is an
16 environmentally friendly fuel.

17 138. In several advertisements in *The Washington Post*—e.g., “Why natural gas will thrive
18 in the age of renewables,” “Real climate solutions won’t happen without natural gas and oil,”
19 “Low- and no-carbon future starts with natural gas”—API has misleadingly touted natural gas as
20 “part of the solution” to climate change. API claims natural gas is “clean.” API also promotes
21 natural gas’s purported benefits through a campaign titled “Energy for a Cleaner Environment.”
22 As part of this campaign, API has offered on its website, in social media posts, and in other
23 advertisements that have reached Californians, the image on the following page, of lush greenery
24 and a message that “88% of Americans favor energy companies helping meet environmental
25 challenges.” API elaborates within the advertisement that “natural gas and oil [] powers and
26 supports modern living . . . with lower emissions.”

Energy For A Cleaner Environment

Energy is fundamental to the lives we want to live - free, safe and healthy, with broad opportunity. Delivering the natural gas and oil that powers and supports modern living means doing so with lower emissions and improved products and operations. In all of these, industry is helping lead the way.

Figure 9: API, We Are America's Generation Energy

139. API further claims, falsely, that, “[n]atural gas is an economical, environmentally friendly complement to renewable energy. The sooner green activists realize that, the more effective they’ll be at continuing to slash emissions.” API’s misleading messaging regarding the alleged environmental benefits of natural gas, coupled with its positive environmental imagery and messaging, is likely to mislead reasonable consumers by suggesting that fossil fuels, in particular natural gas, are environmentally beneficial and not harmful to the climate. In reality, the majority of natural gas is derived from fossil fuels, and its primary constituent is methane, a potent greenhouse gas which plays a significant role in accelerating climate change. Methane has a relatively short lifespan, but its global warming potential is approximately 28 times greater than an equivalent weight of carbon dioxide over a 100-year time period, and approximately 84 times greater than carbon dioxide over a 20-year timeframe. Accounting for methane leaks, flaring, and venting in production and supply chains, as well as combustion of natural gas, the net GHG

1 emissions of natural gas are on a par with—and sometimes higher than—the GHG emissions
2 from coal combustion. Moreover, combustion of methane for use as a fuel emits carbon dioxide.
3 Methane is the second largest component of GHG emissions in California, behind carbon dioxide.

4 **2. Defendants’ Affirmative Claims That They Contribute Substantially**
5 **to Climate Change Solutions Are Likely to Mislead California**
6 **Consumers**

7 140. Recognizing a shift in consumer knowledge and understanding of climate change,
8 Defendants have changed tactics from seeking to deceive the public about the science and reality
9 of climate change to deceptively portraying themselves as part of the solution to climate change.
10 The Fossil Fuel Defendants tout their climate-friendly investments in “clean” fuels and renewable
11 energy, when in fact those investments are nonexistent or miniscule in comparison to the Fossil
12 Fuel Defendants’ investments in developing and expanding their fossil fuel production. In many
13 cases, those “clean” fuels themselves contribute substantially to climate change. Defendants also
14 market themselves as being in alignment with international goals to reduce GHG emissions, while
15 instead working to grow the Fossil Fuel Defendants’ fossil fuel businesses and increase profits
16 generated from fossil fuel sales. Thus, Defendants’ efforts to mislead the public about climate
17 change have not stopped. Defendants have simply shifted gears to engage in a different form of
18 deceptive conduct. In doing so, their marketing presents another lie to California consumers: that
19 Defendants have made and are making substantial contributions to solving climate change.

20 141. By deceptively portraying themselves and their products as part of the climate
21 solution, rather than as the problem, Defendants’ advertisements induce consumers to purchase
22 fossil fuel products and develop brand affinity under the misimpression that purchasing and using
23 fossil fuels will somehow contribute to a “greener” energy future rather than contributing to
24 climate change.

25 142. In reality, the Fossil Fuel Defendants’ expansion of their fossil fuel businesses and
26 insubstantial investments in non-GHG-emitting technology belie Defendants’ purported
27 commitments to solving climate change. The following are but a few examples of Defendants’
28 attempts to falsely portray themselves as being aligned with solutions to the climate crisis, rather
than continuing to be the problem.

1 143. Exxon misleadingly promotes itself to consumers as a “green” company through its
2 alleged commitment to developing clean energy solutions. Exxon also has announced its ambition
3 to achieve net-zero GHG emissions by 2050, and touts its commitment to helping society reach a
4 lower-emissions future. Exxon has heavily promoted its investment in developing algae for use as
5 a biofuel to reduce emissions and combat climate change. Exxon’s advertising tells consumers
6 that Exxon is working to decrease its carbon footprint and that its research is leading toward “A
7 Greener Energy Future. Literally.”

8 144. Exxon’s investment in potential renewable fuels, such as biofuels, and in other
9 potential lower-emission fuels and technologies, has been miniscule compared to its overall
10 profits and to its investments in developing and expanding its fossil fuels business. For example,
11 one analysis comparing Exxon’s advertised goal of producing 10,000 barrels of biofuels per day
12 by 2025 to Exxon’s fossil fuel refinery operations found that the goal for biofuel production
13 would amount to only 0.2% of Exxon’s refinery capacity, as reported in 2019—in essence, a
14 rounding error. Also, Exxon’s advertisements touting the development of biofuels from plant
15 waste substantially overplayed the likely environmental benefits by failing to acknowledge the
16 intensive energy required to process that plant waste, which would create substantial additional
17 GHG emissions. As of late 2022, Exxon quietly abandoned its investments in developing algae as
18 a biofuel, but Exxon continues to invest in its development of fossil fuels, as it has done for
19 decades.

20 145. Exxon’s misleading advertisements have been published across California media
21 outlets, among others. For example, in a video advertisement Exxon ran on *SFGate.com*¹⁴³ on at
22 least November 3, 2020, Exxon claims: “In these **unprecedented times, the challenges** we face
23 can seem daunting, but some things remain **unchanged**, like our commitment to providing
24 **cleaner, reliable energy.**” The video shows this image of sun peeking through the branches of a
25 pristine forest, all superimposed on a background of bubbles rising through clear blue water, to
26 represent Exxon’s apparent “commitment” to clean energy:

27 _____
28 ¹⁴³ *SFGate.com* is a news website based in San Francisco, California, which was formerly
the digital home of the *San Francisco Chronicle*.

Figure 10: ExxonMobil November 3, 2020 *SFGate* Video Advertisement

146. As another example, in a video advertisement Exxon ran on *The Sacramento Bee*'s website in August 2021, a narrator asks the viewer to “imagine if 100 million metric tons of CO₂ could be captured and stored every year.” The narrator then proclaims, “It’s possible. ExxonMobil is working to advance climate solutions.” The narrator does not explain that in 2021, Exxon’s sales of fossil fuel products were responsible for 690 million metric tons of CO₂ emissions (much more than Exxon proposes to “capture”), or that, even if the plan at issue is approved and successful, 100 million metric tons would not be captured annually until 2040.

147. In a video posted on X (formerly Twitter) in 2022, Exxon states that it is the “first company to capture more than 120 million metric tons of CO₂.” The company explains, “That’s like taking all the cars in Texas, Arizona and California off the road – 26 million cars, gone for an entire year.” The advertisement then states that removing 100 million metric tons of CO₂ would be “equivalent to planting a forest the size of California.”

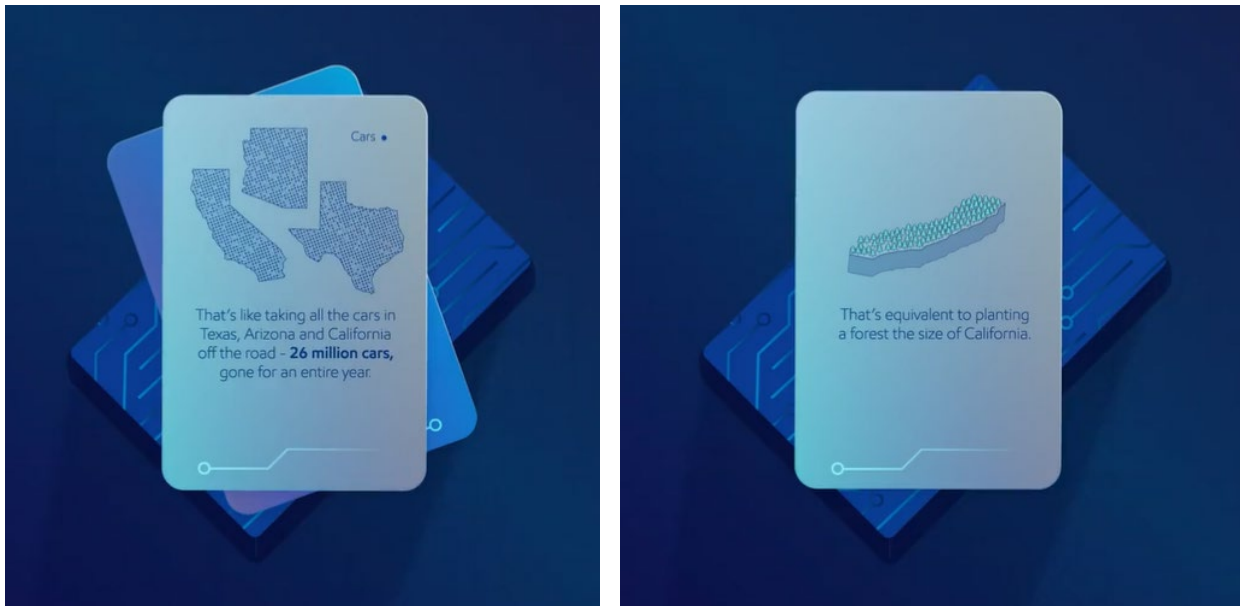

Figure 11: Exxon January 6, 2022 Social Media Advertisement (X, formerly Twitter)

Exxon’s advertisement misleadingly implies that because of Exxon’s carbon capture efforts, CO₂ emissions equivalent to more than all of the cars driven in California for a year are “gone.” In fact, a significant amount of the captured CO₂ is used to extract more oil, which in turn produces more CO₂ emissions. Of the estimated 120 million metric tons of CO₂ captured at one of Exxon’s facilities, reportedly 95% was used to extract more oil.

148. In another video advertisement on *The Sacramento Bee*’s website, Exxon proclaims that “risks associated with climate change must be managed” and then misleadingly asserts that “fracking is a proven and safe solution.” The advertisement then directs the viewer to learn more at Exxchange.com, an Exxon website that falsely describes natural gas as “clean-burning.” In this advertisement, Exxon fails to explain that the production and combustion of natural gas produces potent GHGs, like methane, that contribute to climate change, and that natural gas is far from a “clean” energy source, let alone a solution to climate change. To the contrary, natural gas is a significant contributor to climate change: methane from natural gas is a GHG that exacerbates climate change, and methane emissions associated with natural gas exploration, development, and use are 28 to 84 times as powerful as CO₂ at trapping heat in the atmosphere.

149. Shell also falsely portrays itself to consumers as part of the climate solution. Shell claims that it aims to become a net-zero emissions¹⁴⁴ energy business by 2050, and that it is “tackling climate change.” For example, an advertisement ran as recently as November 18, 2022, on the mobile website of the *Whittier Daily News* suggesting—in neon green text—that Shell is “creating a net-zero world”:

¹⁴⁴ “Net-zero” means achieving a balance between the carbon emitted into the atmosphere, and the carbon removed from it.

Figure 13: Shell November 18, 2022 *Whittier Daily News* Online Display Advertisement

150. However, in June 2023, Shell announced that it would no longer reduce annual oil and gas production through the end of the decade as previously announced, after selling off oil-producing assets and claiming the reduction in its own production as a reduction in emissions. Shell’s CEO told the BBC that cutting oil and gas production would be “dangerous and irresponsible.” In March 2024, Shell weakened its carbon reduction targets for 2030 and abandoned its 2035 carbon intensity target.

151. In advertisements in *The New York Times* and *The Washington Post*, Shell touts its investments in “lower-carbon transport fuels,” including natural gas. In “The Mobility Quandary,” under a “Finding Sustainable Solutions” banner, Shell singles out natural gas as “a critical component of a sustainable energy mix” and a “cleaner-burning fossil fuel.” In “The Making of Sustainable Mobility,” Shell describes natural gas as “a cleaner fossil fuel” with a “lighter carbon footprint.” Shell’s advertising fails to acknowledge, however, that natural gas production and combustion produce potent GHGs, and the net GHG emissions of natural gas are on a par with—and sometimes higher than—the GHG emissions from other fossil fuels.

152. Moreover, Shell’s investments in clean energy pale in comparison with its investments in fossil fuel production. In the first half of 2023, Shell reported \$11.6 billion in total spending, of which less than \$1 billion went to renewables and “energy solutions”—a category that also includes fossil fuel investments such as marketing and trading of pipeline gas. In 2018, speaking at the Oil and Money conference in the U.K., Shell’s CEO, after acknowledging the challenge of climate change and referring to recent headlines about Shell’s investments in the

1 clean energy industry, such as acquiring the renewable electricity company First Utility, said,
2 “even headlines that are true can be misleading. They might even make people think we have
3 gone soft on the future of oil and gas. If they did think that, they would be wrong.” Leaving no
4 doubt about Shell’s plans regarding clean, renewable energy, or lack thereof, he stated that
5 “Shell’s core business is, and will be for the foreseeable future, very much in oil and gas.”

6 153. Using a remarkably similar playbook, Chevron claims that it “is committed to
7 addressing climate change” and touts its intentions to invest billions of dollars in carbon reduction
8 projects, as well as its net-zero “aspirations.” And Chevron’s director states in a 2021 report, “We
9 believe the future of energy will be lower carbon, and we intend to be a leader in that future.” Its
10 CEO claims that Chevron’s “work to create fuels of the future—like hydrogen, renewable diesel,
11 and sustainable aviation fuel—seeks to lower the carbon intensity of these products and support
12 our customers’ efforts to reduce their greenhouse gas emissions.” Chevron representatives have
13 even delivered public seminars at top educational institutions, deceptively claiming Chevron uses
14 its “unique capabilities, assets and expertise to deliver progress” toward the global ambition of
15 achieving net-zero carbon emissions.

16 154. Chevron’s advertising touts the various measures it will take to reach net-zero in
17 2050. In one such online video advertisement that ran as recently as 2022, Chevron’s Executive
18 Vice President, Joe Geagea, proclaimed that Chevron “operate[s] the largest carbon capture and
19 sequestration project in the world.” Geagea also stated, “People think of us as an energy
20 company, but at the heart of it we are a technology company.”

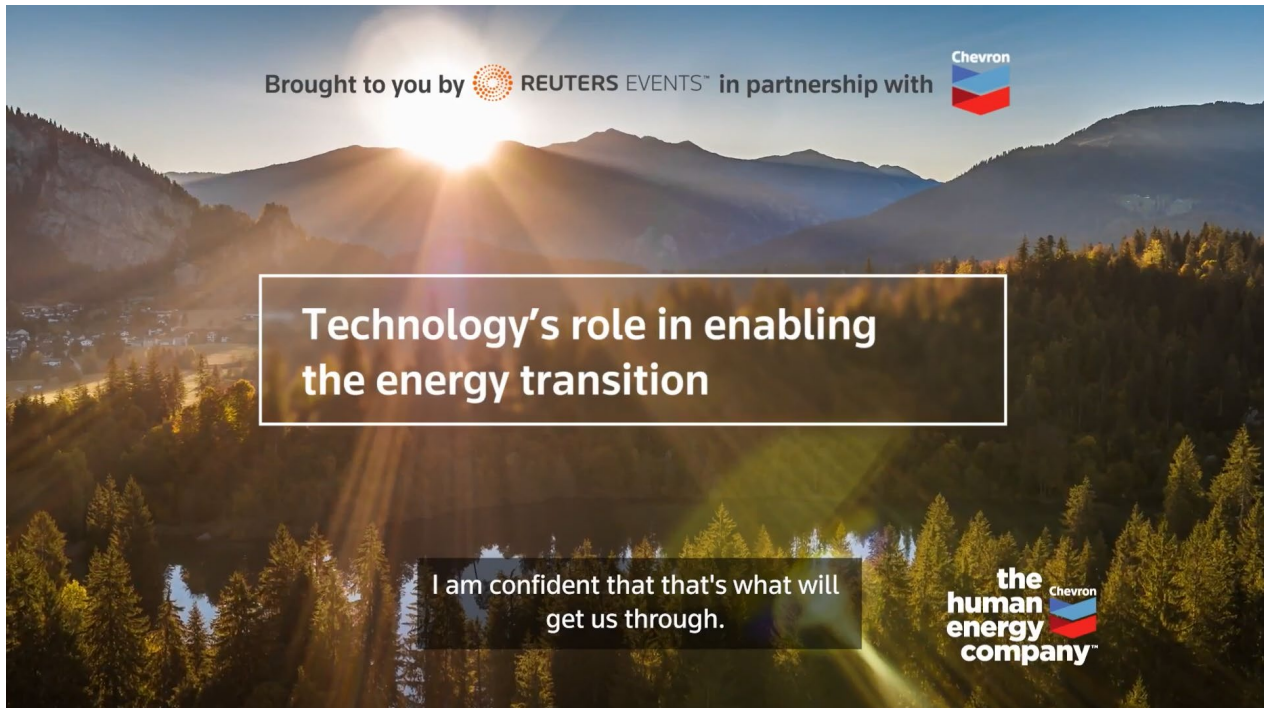

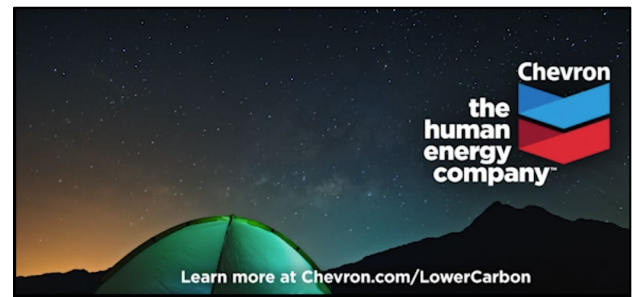

Figure 14: Chevron January 8, 2022 Thomson Reuters Advertisement

The advertisement fails to mention that as of early 2022, the carbon capture and sequestration project, located in Australia, had failed to meet its carbon capture targets since it began injecting CO₂ in 2019. And as recently as 2023, the project has been operating at only one-third of its planned capacity.

155. Chevron has saturated the California media market with advertisements casting itself as a good environmental citizen. For example, advertisements show motivational images of individuals enjoying the environment—for example, hiking, stargazing, and camping. In those advertisements, the narrator reassures the viewer: “We believe the future of energy is lower carbon.” Below are stills from an example video advertisement that ran as recently as October 31, 2021, on the *San Francisco Examiner*’s website. This video touts Chevron’s investment in a nuclear fusion start-up.

14 **Figure 15: Chevron October 31, 2021 *San Francisco Examiner* Video Advertisement**

15 156. Chevron announced investments in a nuclear fusion company in 2020, but did not
16 disclose the amount invested. However, the total funding raised by that company from all
17 investors through the date of the advertisement above was approximately \$34 million; even if
18 Chevron had been the sole investor (which it was not), that amount would represent just 0.04% of
19 Chevron’s total investments in 2020 and 2021. Chevron’s minimal efforts in the area of
20 renewable and lower-carbon energy, coupled with its expansion of its fossil fuel business, belie
21 its statements suggesting that it is part of the climate change solution. From 2010 to 2018,
22 according to one analysis, Chevron’s investments in low-carbon energy sources were only 0.2%
23 of Chevron’s capital spending, compared to 99.8% in continuing its fossil fuel exploration and
24 development. Chevron to this day continues to prioritize capital expenditures in its traditional
25 fossil fuel business over its investments in renewable and low-carbon energy.

26 157. ConocoPhillips claims, similarly, that its “actions for [its] oil and gas operations are
27 aligned with the aims of the Paris Agreement” and touts its actions and achievements toward the
28 net-zero energy transition. But these claims are contradicted by the company’s substantial

1 investments in expanding its fossil fuel production and sales. For example, the company’s new
2 Willow Project in Alaska is expected to produce approximately 576 million barrels of oil, with
3 associated indirect GHG emissions equivalent to 239 million tons of CO₂. Moreover,
4 ConocoPhillips reported that it spent \$150 million on emissions reductions and low-carbon
5 opportunities in 2022—merely 1.5% of its capital investments that year.

6 158. Similarly, in a 2021 promotional video on Facebook, Phillips 66 proclaims that it is
7 “committed to helping the world address climate change.” The message is accompanied by an
8 image of what appears to be a Phillips 66 refinery worker gently brushing some tall wild grass.

9
10
11
12
13
14
15
16
17
18
19 **Figure 16: Phillips 66 October 1, 2021 Social Media Advertisement (Facebook)**

20 The advertisement highlights Phillips 66’s plans to invest in new technologies, support electric
21 vehicle production, use renewable power in its operations, and produce “over 1.5 billion gallons
22 of renewable fuels” annually by 2030. However, these investments are dwarfed by the scale of
23 Phillips 66’s investments in fossil fuel production. Even if Phillips 66 were to meet its goal of
24 producing 1.5 billion gallons of renewable fuels, this would amount to just 5% of Phillips 66’s
25 annual refining capacity in 2023.

26 159. BP also has misleadingly portrayed itself, and continues to misleadingly portray
27 itself, as a climate leader, claiming that it aims to be a net-zero company by 2050 or sooner and to
28 help the world get there too. Further, BP emphasized in its “Possibilities Everywhere” campaign,

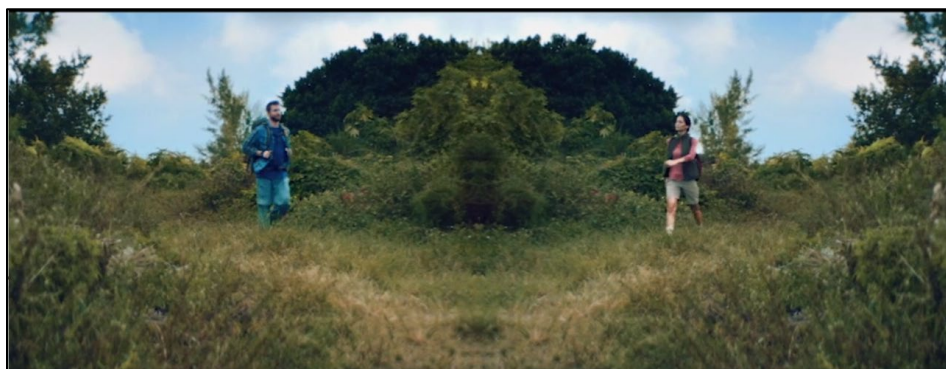

1 which it ended in 2020, the company’s investments in renewable energy, such as solar and wind
2 energy, and “cleaner” energy like natural gas. In its “Blade Runner” advertisement, BP claims
3 that it is “one of the major wind energy businesses in the US.” BP has run its misleading
4 advertisements across California and in national media outlets. For example, in 2023 BP ran a
5 series of advertisements touting its investments in offshore wind, electric vehicle chargers, and
6 solar energy. These advertisements, featuring a bright blue and green color scheme, appeared on
7 the websites of several different media outlets, including the *Los Angeles Times* and *ABC 7 San*
8 *Francisco*.

9 160. In these advertisements, BP failed to mention that its investments in clean energy
10 resources have been relatively meager. From 2010 to 2018, according to one analysis, BP only
11 devoted 2.3% of its capital expenditures to clean energy development. BP also failed to mention
12 that in 2019, at the time of its “Blade Runner” advertisement, BP only owned about 1% of the
13 installed wind capacity in the U.S. Moreover, at a time of record-breaking profits, BP is scaling
14 back its plan to lower emissions by 2030, and BP continues to make significant investments in
15 fossil fuel production, refining, and sales.

16 161. API is also no stranger to misleading the public into believing that its and its
17 members’ actions are part of the solution, rather than the source of the problem. API markets
18 itself as being an environmental steward, committed to helping reduce GHG emissions. API’s
19 2021 Climate Action Framework portrays the organization as a partner in moving towards a
20 climate solution, stating: “Our industry is essential to supplying energy that makes life modern,
21 healthier and better while doing so in ways that tackle the climate challenge: lowering emissions,
22 increasing efficiency, advancing technological innovation, building modern infrastructure and
23 more.” Tellingly, however, API’s strategy does not advocate for or even mention reduction in
24 fossil fuel production as a strategy to protect the climate. Rather, it focuses on potential technical
25 advances and shifting to heavier reliance on natural gas as a “clean fuel.” And an internal API
26 email shows that its Climate Action Framework was in fact organized around the purpose of “the
27 continued promotion of natural gas in a carbon constrained economy.” As discussed above,
28 natural gas is far from a “clean” fuel, as API misleadingly claims, as natural gas production and

1 use contributes substantially to climate change through the release of methane, an extremely
2 potent greenhouse gas.

3 162. API delivers its messages to Californians through advertisements in California media
4 outlets, among others. For example, in a video captured from *Coast News Group* (which covers
5 Northern San Diego County) on February 14, 2020, API claims that “innovators in America’s
6 natural gas and oil companies have teamed up with America’s brightest minds and reduced
7 carbon emission levels to the lowest in a generation.” Viewers are shown images of joggers and
8 hikers, as shown below. The message is clear (and false): Consumers need not worry and can
9 consume fossil fuels as normal because the oil and gas industry has climate change under control.

23 **Figure 17: API February 14, 2020 *Coast News* Video Advertisement**

24 **H. Defendants’ Concealments and Misrepresentations Regarding the Dangers**
25 **of Fossil Fuel Products Encouraged Continued Use of Fossil Fuels and**
26 **Discouraged Concerted Action on Greenhouse Gas Emissions**

27 163. As a result of Defendants’ efforts to deny and undermine climate science and conceal
28 the dangers of fossil fuel consumption, Defendants encouraged consumers to continue to use
fossil fuels and to make investments in cars, appliances, and other major purchases that would

1 commit them to consuming fossil fuels well into the future, and discouraged policymakers from
2 imposing regulations limiting the use of fossil fuels.

3 164. As a result of Defendants' sustained and widespread campaign of disinformation,
4 many California consumers have been unaware of the strength of the scientific consensus about
5 the relationship between consumption of fossil fuels and climate change, the magnitude of the
6 threat posed by their own use of fossil fuels, or of the contribution their purchasing behavior
7 makes to aggravating the effects of climate change.

8 165. By misleading California consumers about the climate impacts of using fossil fuel
9 products, and by failing to disclose the climate risks associated with their purchase and use of
10 those products, Defendants deprived consumers of information about the consequences of their
11 purchasing decisions. This led to consumers using more fossil fuels, and using fossil fuels less
12 efficiently, than they otherwise would have done in the absence of Defendants' deception.

13 166. As with cigarettes, history demonstrates that when consumers are made aware of the
14 harmful effects or qualities of the products they purchase, they often choose to stop purchasing
15 them, to reduce their purchases, or to make different purchasing decisions. More than 40 percent
16 of adults in the United States smoked cigarettes in the early 1970s; recent data indicate that the
17 current figure is 12 percent. This phenomenon holds especially true when products have been
18 shown to harm public health or the environment. For example, increased consumer awareness of
19 the role of plastics in harming human health and the environment has spurred a growing market
20 for plastic-free products and packaging. With access to information about health and
21 environmental impacts, consumers have demanded healthier choices, and the market has
22 responded.

23 167. A consumer who received accurate information that fossil fuel use was a primary
24 driver of climate change, and about the resultant dangers to the environment and to public health,
25 might have decreased the consumer's use of fossil fuel products and/or demanded lower-carbon
26 transportation options from policymakers. Indeed, recent studies and surveys have found that
27 consumers with substantial awareness of climate change are largely willing "to change their
28

1 consumption habits . . . to help reduce the impacts of climate change.”¹⁴⁵ If consumers were
2 aware of what the Defendants knew about climate change when the Defendants knew it,
3 consumers might have opted to avoid or minimize airplane travel; avoid or combine car travel
4 trips; carpool; switch to more fuel-efficient vehicles, hybrid vehicles, or electric vehicles; demand
5 more charging infrastructure for electric vehicles; use a car-sharing service; seek transportation
6 alternatives all or some of the time, if and when available (e.g., public transportation, biking, or
7 walking); or adopt any combination of these choices. In addition, informed consumers often
8 attempt to contribute toward solving environmental problems by supporting companies that they
9 perceive to be developing “green” or more environmentally friendly products.¹⁴⁶

10 168. As described herein, by casting doubt upon the scientific consensus on climate
11 change, Defendants deceived consumers about the relationship between consumption of fossil
12 fuels and climate change, and the magnitude of the threat posed by fossil fuel use. Consumers
13 equipped with complete and accurate knowledge about the climate and the public health effects of
14 continued consumption of fossil fuels would have likely formed a receptive customer base for
15 clean energy alternatives decades before such demand in fact developed. Instead, Defendants’
16 campaign of deception allowed them to exploit public uncertainty to reap substantial profits.

17 169. As described herein, Defendants’ campaign of deception was also aimed at
18 discouraging policymakers and lawmakers from taking action on climate change. By
19 downplaying the scientific consensus on climate change and emphasizing uncertainty, Defendants
20 hoped to delay any regulatory action that might seek to reduce or control GHG emissions, thereby
21 threatening the industry’s profits.¹⁴⁷

28 [global-warming-september-2021.pdf](https://climatecommunication.yale.edu/wp-content/uploads/2021/12/consumer-activism-on-global-warming-september-2021.pdf) (as of June 5, 2024). About a third of American consumers surveyed report “reward[ing] companies that are taking steps to reduce global warming by buying their products” and “punish[ing] companies that are opposing steps to reduce global warming by not buying their products.” (*Id.* at p. 3.)

¹⁴⁷ See, e.g., *supra*, ¶¶ 51, 99.

1 170. By sowing doubt in the minds of consumers, the media, policymakers, and the public
2 about the magnitude and the urgency of climate threats, Defendants delayed regulatory action on
3 GHG emissions, exacerbating the climate crisis and causing significant harm to California and its
4 residents.

5 **I. The Effects of Defendants’ Deceit Are Ongoing**

6 171. The consequences of Defendants’ tortious misconduct—in the form of
7 misrepresentations, omissions, and deceit—began decades ago, and continue to be felt to this day.
8 As described above, Defendants, directly and/or through membership in other organizations,
9 misrepresented their own activities, the fact that their products cause climate change, and the
10 danger presented by climate change.

11 172. Defendants’ collective goal was to ensure that “[a] majority of the American public,
12 including industry leadership, recognizes that significant uncertainties exist in climate science,
13 and therefore raises questions among those (e.g. Congress) who chart the future U.S. course on
14 global climate change.”¹⁴⁸ In 2023, only 20% of Americans understand how strong the level of
15 consensus is among scientists that human-caused global warming is happening, and 28% think
16 climate change is caused mostly by natural changes in the environment.¹⁴⁹

17 173. Defendants’ misrepresentations, omissions, and deceit had a significant and long-
18 lasting effect on how the public views climate change and the dangers of fossil fuel use that
19 continues to the present day. By sowing doubt in the minds of the public, Defendants
20 substantially altered the public discourse on climate change, and intentionally delayed action on
21 climate change, ensuring that they would continue to earn immense revenues and profits.

22 174. If Defendants had been forthcoming about their own climate research and
23 understanding of the dangers of fossil fuel products, consumers, policymakers, and the public

1 could have made substantial progress in transitioning to a lower-carbon economy, at a much
2 earlier time, potentially averting some of the effects of the climate crisis that California is
3 experiencing today.

4 175. Moreover, by concealing the very fact of their campaign of deception, including by
5 using front groups to obscure their own involvement in the deception, Defendants concealed their
6 unlawful conduct from the public and the State, thereby preventing the State from discovering the
7 facts underlying the claims alleged herein.

8 176. Due to Defendants' deceptive and misleading conduct, California is in the throes of a
9 climate crisis—one that would have been avoidable in part had Defendants acted differently.

10 **J. The State Has Suffered, Is Suffering, and Will Suffer Injuries from**
11 **Defendants' Wrongful Conduct**

12 177. Defendants' individual and collective conduct is a substantial factor in causing harms
13 to California. This conduct includes, but is not limited to, their wrongful promotion of fossil fuel
14 products, their concealment of the known hazards associated with the use of those products, and
15 their public deception campaigns designed to obscure the connection between these products and
16 climate change and its public health, environmental, physical, social, and economic
17 consequences. Such consequences include, but are not limited to, the following: extreme heat;
18 drought; wildfires; increased frequency and intensity of extreme weather events, including coastal
19 and inland storms and associated flooding; habitat loss and species impacts; sea level rise and
20 attendant flooding, erosion, damage to riparian lands and submerged lands, and loss of wetlands
21 and beaches; ocean warming and acidification; and the cascading social, economic, health, and
22 other consequences of these environmental changes. These adverse impacts will continue to
23 increase in frequency and severity in California and disproportionately impact frontline
24 communities.

25 178. As an actual and proximate result of Defendants' conduct, which was a substantial
26 factor in bringing about the aforementioned environmental changes, the State has suffered and
27 will continue to suffer severe harms and losses. These include, but are not limited to, the
28 following: increased costs associated with public health impacts, environmental impacts, and

1 economic impacts; injury or destruction of state-owned or -operated facilities and property
2 deemed critical for operations, utility services, and risk management, as well as other assets that
3 are essential to community health, safety, and well-being; increased costs for responding to
4 increasingly frequent natural disasters and increasingly intense weather events, including extreme
5 heat, drought, wildfires, coastal and inland storms and associated flooding, and extreme
6 precipitation events; and increased planning and preparation costs for community adaptation and
7 resilience to climate change's effects.

8 179. The State has incurred, and will foreseeably continue to incur, as a result of
9 Defendants' deceptive conduct as described in this Complaint, injuries due to delays in taking
10 action to mitigate or curtail the climate crisis. As a result of Defendants' wrongful conduct,
11 California has experienced, is experiencing, and will continue to experience significant adverse
12 impacts, including, but not limited to, those described below.

13 **1. Extreme Heat**

14 180. California is being impacted and will continue to be impacted in years and decades to
15 come by higher average temperatures and more frequent and severe heat waves. The last nine
16 years have been the nine hottest on record, and that trend is only expected to continue. These
17 changes will pose a risk to every region of the state. Severe harms from rising temperatures are
18 already a reality in many frontline communities. Members of frontline communities tend to work
19 in occupations with increased exposure to extreme heat, such as the agricultural, construction, and
20 delivery industries.

21 181. Globally, increased concentrations of carbon dioxide and other gases in the
22 atmosphere are causing a continuing increase in the planet's average temperature. California
23 temperatures have risen since records began in 1895, and the rate of increase is accelerating.

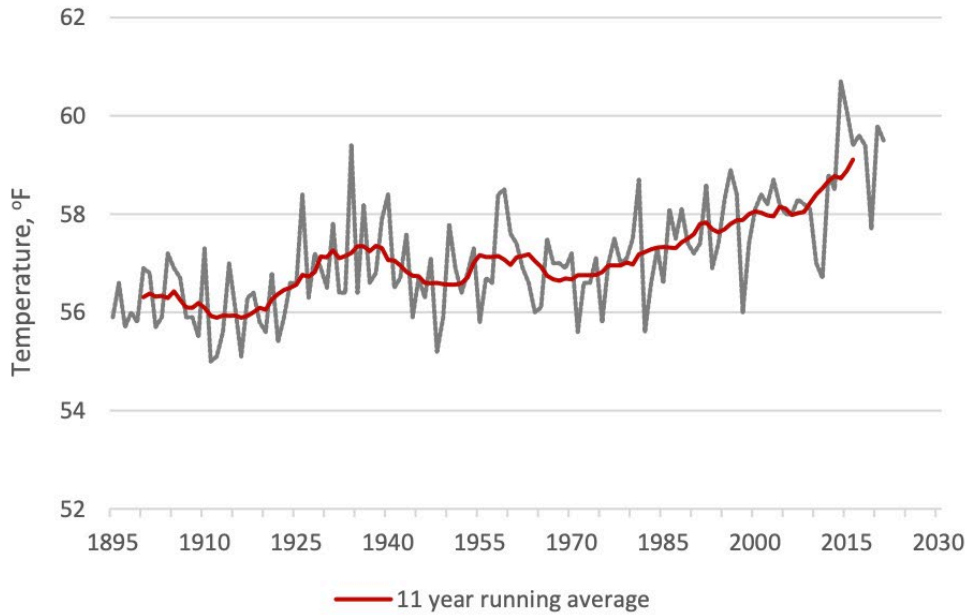

Figure 18: Statewide Annual Average Temperatures

182. Death Valley recorded the world’s highest reliably measured temperature (130°F) in July 2021, breaking its own record (129°F) set in summer 2020. Meanwhile, the City of Fresno also broke one of its own records in 2021, with 64 days over 100°F that year. This is part of a trend: the daily maximum average temperature, an indicator of extreme temperature shifts, is expected to rise by 4.4°F to 5.8°F by 2050 and by 5.6°F to 8.8°F by 2100. Heat waves that result in public health impacts are also projected to worsen throughout California. By 2050, these heat-related health events are projected to last two weeks longer in the Central Valley and occur four to ten times more often in the Northern Sierra region.

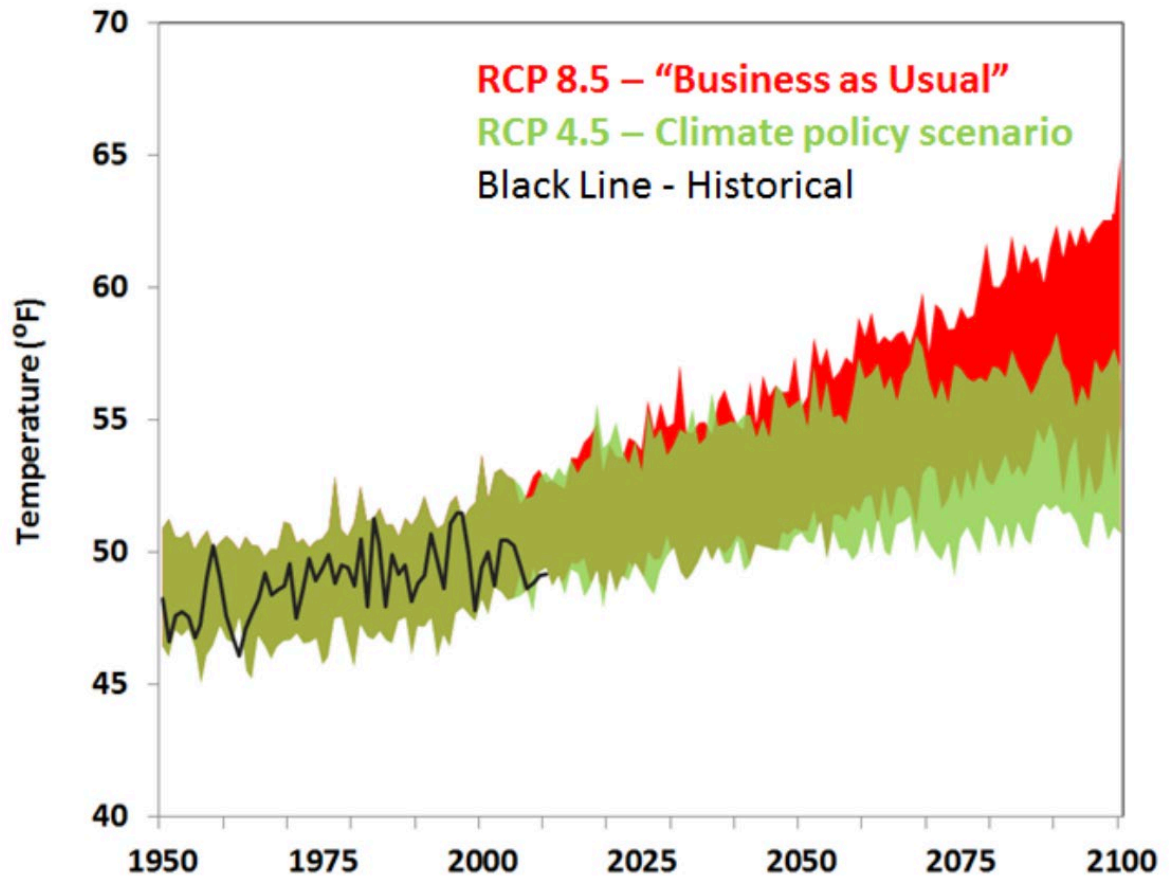

Figure 19: Projected California Temperature Increases¹⁵⁰

183. Recent heat waves have broken heat records and caused serious illness across the state, and these events are becoming more frequent. Heat waves have a particularly high impact in Southern California, where they have become more intense and longer-lasting. In the past two years, Los Angeles recorded 121°F, and the Coachella Valley had its hottest year ever, with temperatures reaching 123°F. In urbanized environments, pavement, cement, and other non-vegetated areas contribute to the “heat island” effect, in which built environments retain heat, causing daytime temperatures to be 1° to 6°F hotter than rural areas and nighttime temperatures to be as much as 22°F hotter. The heat island effect is inequitably distributed, and disproportionately

¹⁵⁰ RCP in this graph refers to Representative Concentration Pathways, which are projections based on the emissions scenarios used by the IPCC’s Fifth Assessment Report. There are four RCPs (2.6, 4.5, 6.0 and 8.5), and each RCP represents a family of possible underlying socioeconomic conditions, policy options, and technological considerations, from a low-end scenario (RCP 2.6) that requires significant emissions reductions to a high-end, “business-as-usual,” fossil fuel-intensive emission scenario (RCP 8.5).

1 affects frontline communities. Heat events exacerbate respiratory and cardiac illness and cause
2 emergency room visits to soar. Young children, the elderly, people with preexisting health
3 conditions, and African Americans are more vulnerable than the rest of the population to extreme
4 heat events.

5 184. Heat ranks among the deadliest of all climate hazards in California, and heat waves in
6 cities are projected to cause two to three times more heat-related deaths by mid-century. Frontline
7 communities will experience the worst of these effects, as heat risk is associated and correlated
8 with physical, social, political, and economic factors.

9 185. Heat events also lead to increased poultry and livestock mortality, which can lead to
10 potentially adverse impacts to public health, animal health, and the environment, and resultant
11 economic losses. Hotter weather can deteriorate the integrity of containment systems at toxic
12 waste sites.

13 186. Extreme heat also threatens California's natural systems. Increasing temperatures, for
14 example, lead to exacerbated risk of wildfire; drought and its effects on the health of watersheds;
15 and negative effects on plants and animals, including reduced fitness, increased stress, decreased
16 reproduction, migration, death, and in some cases extinction. These shifts result in significant
17 cultural impacts to tribes, where plants and animals that have been used as traditional food,
18 medicine, materials, or in ceremonies are no longer available.

19 **2. Drought and Water Shortages**

20 187. Anthropogenic warming has increased the likelihood, frequency, and duration of
21 extreme droughts in California.

22 188. Over the last three years, the State has earmarked more than \$8 billion to modernize
23 water infrastructure and management, as part of planning for a potential loss of 10% of its water
24 supplies by 2040 due to climate change.

25 189. California's five-year drought of 2012 to 2016 occurred in a setting of then-record
26 statewide warmth and set numerous hydrologic and impact records, including lowest statewide
27 snowpack, groundwater levels in many parts of California falling below previous historical lows,
28

1 and severe resultant land subsidence. This event was soon followed by the 2020-2023 drought,
2 which again set new hydrologic records.

3 190. Snowpack in the Sierra Nevada mountains serves as a vital water storage and supply
4 system for California, supplying roughly 30% of the state's water needs in an average year.
5 Warmer winter temperatures caused by climate change are reducing the fraction of precipitation
6 falling as snow, and increased evaporation is reducing snowpack volume. Recent projections
7 show that the Sierra snowpack could decline to less than two-thirds of its historical average by
8 2050, even if precipitation remains relatively stable.

9 191. Warmer temperatures in the spring and summer cause the snowpack to melt earlier
10 and more quickly. This rapid melting can result in flooding, and can reduce California's supplies
11 of water stored in reservoirs.

12 192. Warmer average temperatures across California will increase moisture loss from
13 soils, which leads to drier summers even if winter precipitation increases. Climate projections
14 show that the seasonal summer dryness in California may start earlier in the spring due to earlier
15 soil drying, and last longer into the fall and winter.

16 193. Droughts have significant environmental, social, and economic repercussions in
17 California, and their impacts are widespread. The 2012-2016 and 2020-2022 droughts impacted
18 most of California and required statewide responses. Future climate-exacerbated droughts are
19 expected to harm the State and its people by, among other things, causing drinking water
20 shortages, damaging the State's agricultural industry, depleting groundwater, devastating aquatic
21 ecosystems, increasing the intensity and severity of wildfires, reducing the availability of
22 hydroelectricity, and harming human health.

23 194. Drinking water shortages primarily affect small drinking water systems and domestic
24 wells, which are often found in rural communities. In 2015, more than 100 small water systems
25 experienced water shortages, and more than 2,000 domestic wells went dry. These vulnerable
26 systems are located throughout California, and approximately half serve frontline communities. In
27 the 2012-2016 drought, some rural frontline communities in the San Joaquin Valley relied on
28 bottled water, interim tanks, and filling buckets and barrels with water from neighboring

1 communities. From July 2021 to August 2023, the State spent over \$100 million providing
2 emergency bottled and hauled water to communities experiencing drinking water shortages.

3 195. California is the top agriculture-producing state in the nation, accounting for more
4 than 60% of the country's production of vegetables and two-thirds of the country's fruit and nut
5 crops. The state's agricultural industry accounts for 40% of total water use in an average year.
6 Drought conditions can result in crop losses and decreased agriculture production, and future
7 water shortages are expected to limit agricultural suitability for various crops. The resulting
8 economic damages will be substantial—in 2016 alone, the impacts of drought on California's
9 agriculture industry resulted in over \$600 million in direct economic damages and the loss of
10 4,700 jobs.

11 196. Reliance on groundwater increases during droughts, when surface water storage is
12 depleted due to reduced precipitation and low snowpack. Overdraft of groundwater may cause
13 land subsidence, which can impact infrastructure—including water conveyance systems, roads,
14 railways, bridges—aquifer storage capacity, and land topography. Increased groundwater
15 pumping during drought also worsens groundwater quality, causing increased contamination of
16 drinking water supplies. Under the Sustainable Groundwater Management Act, which was passed
17 in 2014, the State has spent more than \$300 million to fund Groundwater Sustainability Agencies
18 to manage groundwater resources at the local level.

19 197. Drought harms aquatic ecosystems by causing low water flows, which, among other
20 things, negatively impact water quality by affecting factors like temperature and salinity and
21 increasing the concentration of pollutants in water. As many as 18 California native fish species
22 would have been at high risk of extinction if the 2012-2016 drought had continued. Drought has
23 contributed to a precipitous decline in Chinook salmon populations in California and led to an
24 economically devastating shutdown of California's salmon fishery in 2023. Drought also reduces
25 water availability for California's managed wetlands, harming millions of migratory birds that
26 rely on those wetlands by reducing food and habitat availability.

27 198. Dry conditions produced by droughts can lead to more intense and severe wildfires. A
28 2016 study found that climate-induced warming and drying have created a favorable environment

1 for fires, doubling the area burned by forest fires over the area expected to burn from natural
2 climate variability alone from 1984 to 2015. Several of the largest, most destructive, and deadliest
3 wildfires in state history followed the 2012-2016 drought. The second largest in the State's
4 history, the Dixie Fire, occurred during the 2021 drought year. For additional discussion of
5 wildfire harms, see Section IV.J.3, *infra*.

6 199. Drought can also affect human health by increasing harmful algal blooms, altering
7 patterns of certain vector-borne diseases, increasing the risk of water-borne diseases, and
8 increasing air pollution from wildfires and dust storms.

9 200. The State has borne and will continue to bear the substantial costs associated with
10 mitigating and responding to climate-exacerbated drought impacts.

11 3. Extreme Wildfire

12 201. Climate change has caused and will continue to cause an accelerated increase in the
13 risk, occurrence, and intensity of wildfires in California, resulting in wildfire-related injuries to
14 the State and its residents.

15 202. Wildfire has always been an essential element of California's ecology; however,
16 climate change is leading to disruptions in the state's natural temperature and precipitation
17 patterns that have helped maintain the healthy, balanced role of wildfire in California. The result
18 is a wildfire crisis. Increasingly higher temperatures coupled with longer and more intense
19 droughts have led to substantially drier vegetation and fuel loads across the state that are more
20 easily ignitable during periods of hotter conditions, which are becoming more frequent and more
21 intense in California under climate change. The wildfire season is beginning earlier in the year
22 and ending later, and the footprint of wildfire in California has expanded due to climate change.
23 More than 23 million acres of California wildlands, extended over half the state, are classified as
24 under very high risk of fire, the highest fire hazard severity level. As demonstrated in the figures
25 below, in 2023 compared to in 2007, more areas are at risk of fire, with increased severity of that
26 risk in many areas.

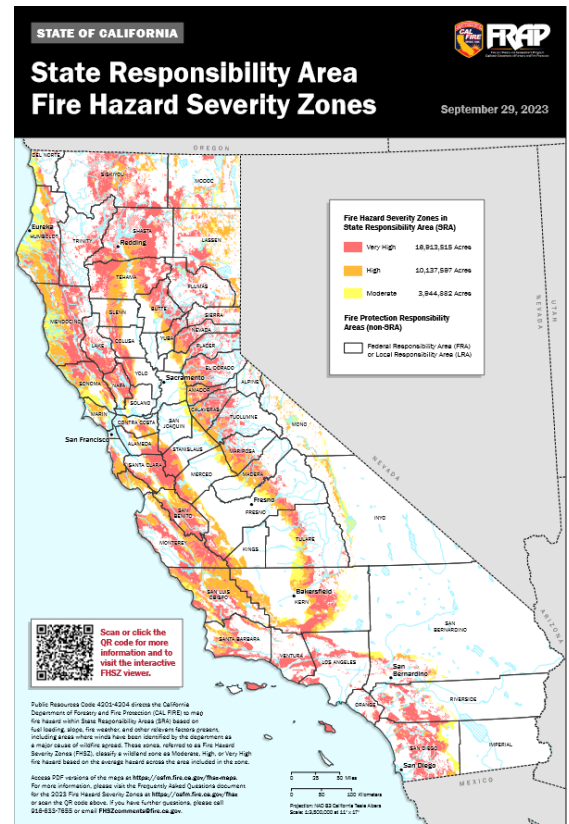

Figure 20: Fire Hazard Severity Zones, 2007 and 2023

Similarly, summer forest burned area during 1996 to 2021 showed a fivefold increase compared to the years 1971 to 1995, and one recent study found that nearly all of the increase in burned area is due to anthropogenic climate change.

203. The evidence is unequivocal that both the severity and intensity of wildfires in California are increasing as a result of climate change. Most of the largest and most destructive fires in California’s history have occurred since 2000, as illustrated by the following chart:

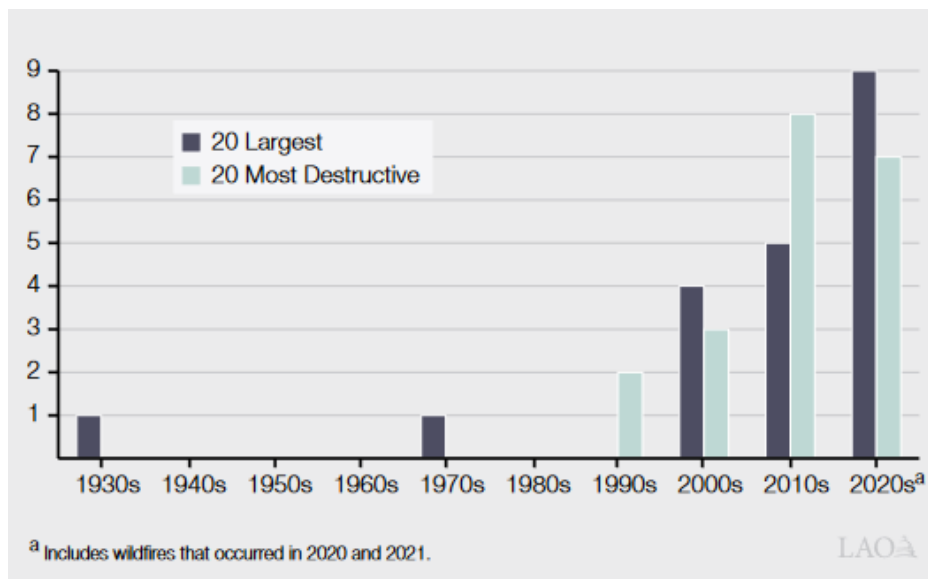

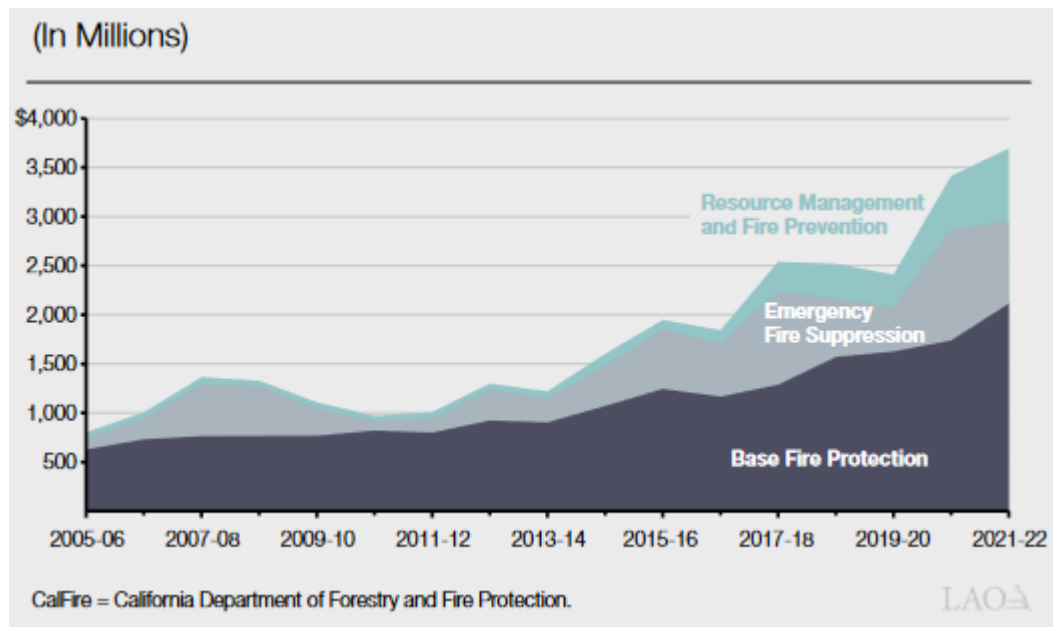

Figure 21: Largest and Most Destructive Wildfires in California

Nine of the 20 largest fires ever in California occurred in 2020 and 2021, after some of the driest and hottest years on record. California saw its largest wildfire season in 2020, when over 4.3 million acres burned (over 4% of the land within California, an area larger than the State of Rhode Island). In that season California also suffered its first gigafire, the August Complex Fire, which burned over a million acres through seven counties. The Camp Fire in 2018 burned fiercely and spread so rapidly that it destroyed the town of Paradise, California, in the fire’s first four hours. The fire was the most destructive and costliest ever in the world, resulting in nearly 19,000 structures destroyed and over \$16 billion in property damage. The fire was also the deadliest in California’s history, with 85 civilian fatalities.

204. Related climate change impacts drive the increased risk, occurrence, and intensity of wildfire in California by impairing the health of forests and vegetation and creating conditions primed for megafires. Episodes of ever-more extreme drought are parching landscapes across California. Higher temperatures and diminishing quantities of available water create increasingly inhospitable conditions for trees at lower elevations and in hotter, drier southern regions. Consequently, new forest trees gravitate northward and upslope, leaving stressed and dying trees behind. Dead trees are more flammable than live trees, furthering California’s wildfire risk. More frequent climate change-induced extreme weather events, such as extended periods of dry, hot, high winds and dry lightning storms, combine with the dangerous conditions on the ground not

1 only to create more wildfires in California but also to fan their flames. In 2020, during one of
 2 California's worst periods of drought, a severe dry lightning storm followed by dry high winds
 3 passed through Central and Northern California and sparked hundreds of wildfires. These fires
 4 were so intense, expansive, and numerous that they became known as the 2020 Fire Siege. This
 5 was a perfect storm of conditions, driven by climate change, creating catastrophic fires.

6 205. These catastrophic, climate change-driven wildfires result in substantial losses to the
 7 State's financial resources. While the State only owns about 3% (approximately one million
 8 acres) of the forestlands within California's boundaries, the State is financially responsible for
 9 wildfire protection for about 40% (over 31 million acres) of California's wildlands
 10 (approximately 79 million acres), which include forestland, watershed, and rangeland. The State
 11 spends billions of dollars on wildfire response annually; however, the cost of fighting more
 12 extreme climate change-driven wildfires is increasing. The State budgets for its response to large
 13 wildfires in the form of an emergency fund, which is funded each year based in part on the
 14 average costs of large wildfires over the previous five years. For the 2020-2021 fiscal year, the
 15 State budgeted \$373 million for the emergency fund, but spent over \$1.3 billion from the
 16 emergency fund during the 2020 Fire Siege. In 2011, the State spent only about \$90 million on
 17 emergency fire suppression, but has not spent as little since.

28 **Figure 22: State Spending on CAL FIRE**

1 206. Once suppressed, climate change-driven wildfires leave shattered communities in
2 their wake, resulting in further financial loss to the State for wildfire recovery efforts. Increased
3 wildfire smoke blankets these communities with ash that contains hazardous chemicals, such as
4 the metals lead, cadmium, nickel, and arsenic; asbestos from older homes or other buildings;
5 perfluorochemicals; flame retardants; caustic materials; and other debris, all of which must be
6 removed before communities can rebuild. In addition to wildfire response, the State incurs further
7 costs for wildfire recovery, including removal of household hazardous waste and wildfire debris
8 in areas impacted by wildfire.

9 207. In addition to suppression and disaster response and recovery costs incurred by the
10 State, the total property loss from recent fire seasons has also climbed to several billions of
11 dollars per year.

12 208. Further, the State has lost precious natural resources to catastrophic, climate change-
13 driven wildfires. During the 2020 Fire Siege, for example, the CZU Lightning Complex Fire
14 effectively destroyed the State's oldest state park, Big Basin Redwoods State Park, and the
15 surrounding forest of primarily coastal redwoods. The park lost all of its historic structures, and
16 the awe-inspiring landscape of towering old- and second-growth coastal redwoods was razed.
17 While old-growth redwoods are known for fire resilience, and while many survived and are
18 currently recovering, it is also becoming clear that changing climatic conditions such as hotter,
19 drier summers and prolonged extreme drought will play a significant role in how the forest of Big
20 Basin Redwoods State Park declines or recovers in the decades to come. The vast majority of the
21 park remains closed indefinitely as it recovers from the damage.

22 209. Substantial natural resource costs from wildfire also extend beyond the forests.
23 Destruction from wildfires deteriorates watersheds, which stresses municipal water supplies and
24 treatment operations. Some smoke plumes from these megafires are so immense and hot that they
25 form pyrocumulus clouds that create their own hazardous weather, such as lightning, hail, and
26 tornadoes. These gigantic billows of smoke travel thousands of miles at both high and low
27 elevations, severely compromising air quality and harming public health.

28

1 210. With the health of forests impaired and conditions worsening as the climate warms,
2 the State has incurred costs and will incur further costs to manage forestlands to prevent future
3 catastrophic, climate change-driven wildfires. Recently, the State has devoted \$2.7 billion over
4 three years to address wildfire resiliency in California.

5 **4. Public Health Injuries**

6 211. Climate change has caused and will continue to cause significant public health-related
7 injuries to the State and its residents.

8 212. Heat causes more reported deaths per year on average in the United States than any
9 other weather hazard. Greater numbers of extreme heat events in California will result in
10 increased risk of heat-related illnesses (from mild heat stress to fatal heat stroke). Certain groups
11 are more vulnerable to heat exposure. These include the elderly, young children, people with pre-
12 existing health conditions (such as heart or lung disease), and African Americans.¹⁵¹ Workers
13 who engage in vigorous physical activity, especially outdoors, are also at risk, including workers
14 in construction, firefighting, and agriculture. Farmworkers die of heat-related causes at 20 times
15 the rate of the rest of the U.S. civilian workforce. Since 2005, the first year California began
16 tracking the number of heat-related fatalities, 36% of California's heat-related worker deaths have
17 been of farmworkers. Similarly, although construction workers comprise only 6% of the national
18 workforce, they account for 36% of heat-related deaths.

19 213. The rate of occupational heat-related deaths in California slightly exceeds the national
20 average. In 2006, dramatic increases in many heat-related illnesses and deaths were reported
21 following a record-breaking heat wave. Over 16,000 excess emergency room visits, over 1,100
22 excess hospitalizations, and at least 140 deaths occurred between July 15 and August 1, 2006.
23 Projections for California estimate about a 10- to 20-fold increase in the number of extremely hot
24 days by the mid-21st century, and about a 20- to 30-fold increase by the end of the century.

25 214. Californians already experience the worst air quality in the nation. Hotter
26 temperatures lead to more smog, which can damage lungs, and increase childhood asthma,

27 ¹⁵¹ Heat deaths or illness are underreported or misclassified. Hence, the available data on
28 heat-related illnesses and deaths likely underestimate the full health impact of exposure to periods
of high temperatures.

1 respiratory and heart disease, and death. Air quality is expected to deteriorate due to rising
2 temperatures, as ground-level ozone and particulate matter concentrations rise. Ozone and
3 particulate matter are associated with a wide range of harmful health effects in humans, including
4 cardiovascular disease, cancer, and asthma.

5 215. The smoke from climate change-driven wildfires has also compromised and will
6 further compromise California’s air quality. Smoke from these fires has reached everywhere in
7 California, clogging the skies, eclipsing the sun, and suffocating Californians’ air. Wildfire smoke
8 is a complex mixture of toxic gases, fine particulate matter, and other pollutants. Most of the state
9 has experienced large increases in wildfire-driven air pollution when comparing air quality data
10 from 2002-2013 with those from 2014-2020. During the 2020 Fire Siege, all of California was
11 covered by wildfire smoke for over 45 days—and 36 counties for at least 90 days. Altogether,
12 more than half of California’s population experienced approximately one month characterized by
13 unhealthy, very unhealthy, or hazardous levels of wildfire smoke during the 2020 fire season. The
14 five highest average daily air pollution readings ever recorded in California occurred in 2020.

15 216. The decline in air quality from wildfire smoke has had pernicious impacts on the
16 State’s public health. Exposure to wildfire smoke has been linked to respiratory infections,
17 cardiac arrests, low birth weight, mental health conditions, and exacerbated asthma and chronic
18 obstructive pulmonary disease. Sensitive groups, such as children, pregnant people, and the
19 elderly; those with underlying health conditions; and those whose occupations require working
20 outdoors with greater exposure to wildfire smoke, such as agricultural workers, suffer an even
21 greater risk of harmful health effects from wildfire smoke. Researchers from Stanford University
22 estimated California wildfire smoke likely led to at least 1,200 and as many as 3,000 excess
23 California deaths between August 1 and September 10, 2020 alone.

24 217. Heavy precipitation, sea level rise, and extreme weather events will lead to more
25 frequent flooding, which causes death and injury in addition to secondary health risks such as
26 damage to sanitation infrastructure, aggravation of chronic diseases, and contamination of
27 drinking water, land, and property which jeopardizes human health and the State economy. As
28 one example, the alternating cycle of heavy precipitation and heat attributed to climate change

1 provides an ideal condition for fungal Valley Fever outbreaks. Sea level rise and increased
2 flooding are also expected to lead to increased risk of contamination and chemical exposure due
3 to flooding of toxic sites. These risks are particularly acute for California because 68.5% of the
4 state’s population lives in the coastal areas. As pest seasons and ranges expand, vector-and tick-
5 borne illnesses will increase in California’s population. The State has borne, and will continue to
6 bear, costs associated with mitigating and responding to these public health threats.

7 **5. Extreme Storms and Flooding**

8 218. Much of California’s winter precipitation arrives in the form of “atmospheric river”
9 storms, which are fed by long streams of water vapor transported from the Pacific Ocean. These
10 storms deliver extreme precipitation when their moisture-laden winds encounter California’s
11 coastal mountain ranges.

12 219. Atmospheric rivers and the heavy precipitation they bring are the major cause of
13 historical floods in California, resulting significant damage to property and public infrastructure
14 and substantial economic losses.

15 220. Studies uniformly show that atmospheric rivers are likely to become more frequent
16 and more intense in the future, in part because warmer air allows atmospheric rivers to hold more
17 moisture. In a warmer future climate, total precipitation in atmospheric river events is projected to
18 increase by about 25% on average throughout the state, and maximum hourly precipitation rates
19 may increase by 30%.

20 221. With the increased likelihood of extreme storms comes an increased risk of
21 catastrophic flooding. Because warming temperatures will cause a lower proportion of winter
22 storms to fall as snow, the predicted 25% increase in total precipitation from atmospheric river
23 events will result in 50% more runoff, posing significant flood risks. Additionally, higher hourly
24 precipitation rates will result in short-duration bursts of intense precipitation, which pose a
25 significant risk of flash flooding and related hazards, such as mudslides.

26 222. One recent study analyzed the likelihood that California would experience a
27 “megaflood” in the future—a historically rare flood caused by 30 consecutive days of
28 precipitation. Researchers found that the annual likelihood of a megaflood increases rapidly for

1 each 1°C of global warming, and that warming as of 2022 has already doubled the annual
2 likelihood of a megaflood. By 2060, megafloods—which historically occurred approximately
3 once every two hundred years—may occur three times per century.

4 223. The State’s water infrastructure consists of dams, reservoirs, aqueducts, canals,
5 spillways, levees, and pumping plants designed to store and transport water and reduce flood risk.
6 Much of this infrastructure was designed to operate within historical ranges of precipitation and
7 temperatures, not the more frequent and intense storms that the State will face in the warming
8 future. The flood improvement investments needed in the Central Valley alone are expected to
9 cost the State between \$1.8 and \$2.8 billion through 2027. In the winter of 2022 to 2023,
10 California experienced a series of severe atmospheric river storms that broke precipitation records
11 throughout the state, with some areas of the state receiving more than 200% of average
12 precipitation. These storms had devastating effects throughout California. More than 80 state park
13 properties were fully or partially closed due to storm impacts. In March 2023, the Pajaro River
14 breached a levee on the border of Monterey and Santa Cruz counties, triggering evacuation orders
15 and warnings for more than 8,500 people, and leaving residents of the unincorporated community
16 of Pajaro without safe drinking water for the next month. In the Central Valley, Tulare Lake—
17 which was drained to support agriculture in the early 1900s and has been largely dry since—
18 reappeared, flooding 168 square miles, and grew in size as the Sierra snowpack melted.

19 224. Floods can cause emergency conditions such as power, water, and gas outages;
20 disrupt transportation routes and commercial supplies; damage homes, buildings, and roads; and
21 cause severe environmental problems, including landslides and mudslides, which require
22 response and recovery efforts by the State. Household, industrial, agricultural, and other wastes
23 can contaminate floodwaters, creating chemical and biological public health risks to impacted
24 communities. Flooding from storms often leads to increased sanitary sewer overflows. Drinking
25 water supplies are often inundated with sewage and other contaminants from flood waters
26 resulting in water use restrictions, including Boil Water Notices and Do Not Drink Orders,
27 limiting or eliminating drinking water for communities. Burn scars from wildfires increase the
28 risk of debris flows during episodes of increased precipitation. Locations downhill and

1 downstream from burned areas are susceptible to flash flooding and debris flows, especially near
2 steep terrain. Rainfall that would normally be absorbed will run off extremely quickly after a
3 wildfire. As a result, after a wildfire, much less rainfall is required to produce a flash flood. The
4 force of the rushing water and debris can damage or destroy culverts, bridges, roadways, and
5 buildings even miles away from the burned area.

6 225. In addition, extreme precipitation events can cause inundation of toxic waste sites,
7 leading containment systems and structures not designed for extreme weather events to fail and
8 release contamination.

9 226. The State has borne, and will continue to bear, the costs of constructing, maintaining,
10 and upgrading water infrastructure, including flood management infrastructure, and otherwise
11 responding to the damage caused by extreme storms and flooding.

12 6. Damage to Agriculture

13 227. California is a global leader in the agricultural sector and produces more than 400
14 types of commodities. The state produces over a third of the country's vegetables and two-thirds
15 of its fruits and nuts. California is the largest and most diverse agricultural state in the United
16 States.

17 228. While California farmers and ranchers have always been affected by the natural
18 variability of weather from year to year, the increased rate and scale of climate change is beyond
19 the realm of experience for the agricultural community.

20 229. Agricultural production in California is highly sensitive to climate change. Changes
21 in temperatures and in the amounts, forms, and distribution of precipitation, increased frequency
22 and intensity of climate extremes, and water availability are a few examples of climate-related
23 challenges to California's agriculture sector. Irrigated agriculture produces nearly 90% of the
24 harvested crops in California, and a decrease in water availability could reduce crop areas and
25 yields. Drought can adversely affect agricultural crop production by slowing plant growth and
26 causing severe crop yield losses. Lower stream flow and groundwater levels as a consequence of
27 drought can harm plants by increasing the risk of wildfires when vegetation and soil surface dry
28 out. Warmer environments can cause greater runoff caused by faster snowmelt. This, in turn,

1 causes reservoirs to fill up earlier, increasing the odds of both winter flooding and summer water
2 deficits. Increasing temperatures result in more flooding events, which greatly affect plant
3 survival through a reduction in oxygen availability, root asphyxia, and an increase in disease and
4 nitrogen losses.

5 230. Changes in California's climate are negatively influencing California's highly
6 productive agricultural industry. Impacts on agriculture include low chill hour accumulations,
7 crop yield declines, increased pest and disease pressure, increased crop water demands, altered
8 phenology of annual and perennial cropping systems, and uncertain future sustainability of some
9 highly vulnerable crops.

10 231. Permanent crops are among the most profitable commodities in California. They are
11 most commonly grown for more than 25 years, which makes them more vulnerable to impacts of
12 climate change. Most of the permanent crops in California require several years to reach maturity
13 and profitable production. California has already observed a significant loss of winter chill hours,
14 due to an increase in average winter temperatures. Winter chill hours are defined as the number of
15 hours spent below 45°F, necessary for the flowers of fruits and nuts to bloom, and required by
16 certain crops to achieve high yields. According to University of California researchers, around the
17 year 1950, growers in the Central Valley could rely on having between 700 and 1,200 chill hours
18 annually. For chilling requirements of 500 hours (chestnut, pecan, and quince), only about 78% of
19 the Central Valley will be suitable for production by the end of the 21st century. For chilling
20 requirements of more than 700 hours (apricot, kiwifruit, peach, nectarine, plum, and walnut), only
21 23–46% of the valley remains suitable, and only 10% will remain suitable by 2080–2095. Only
22 4% of the area of the Central Valley was suitable in the year 2000 for species such as apples,
23 cherries, and pears, which have annual chilling requirements of more than 1,000 hours; however,
24 virtually no areas in California will remain suitable by 2041–2060 under any emissions scenario
25 for these types of fruit crops.

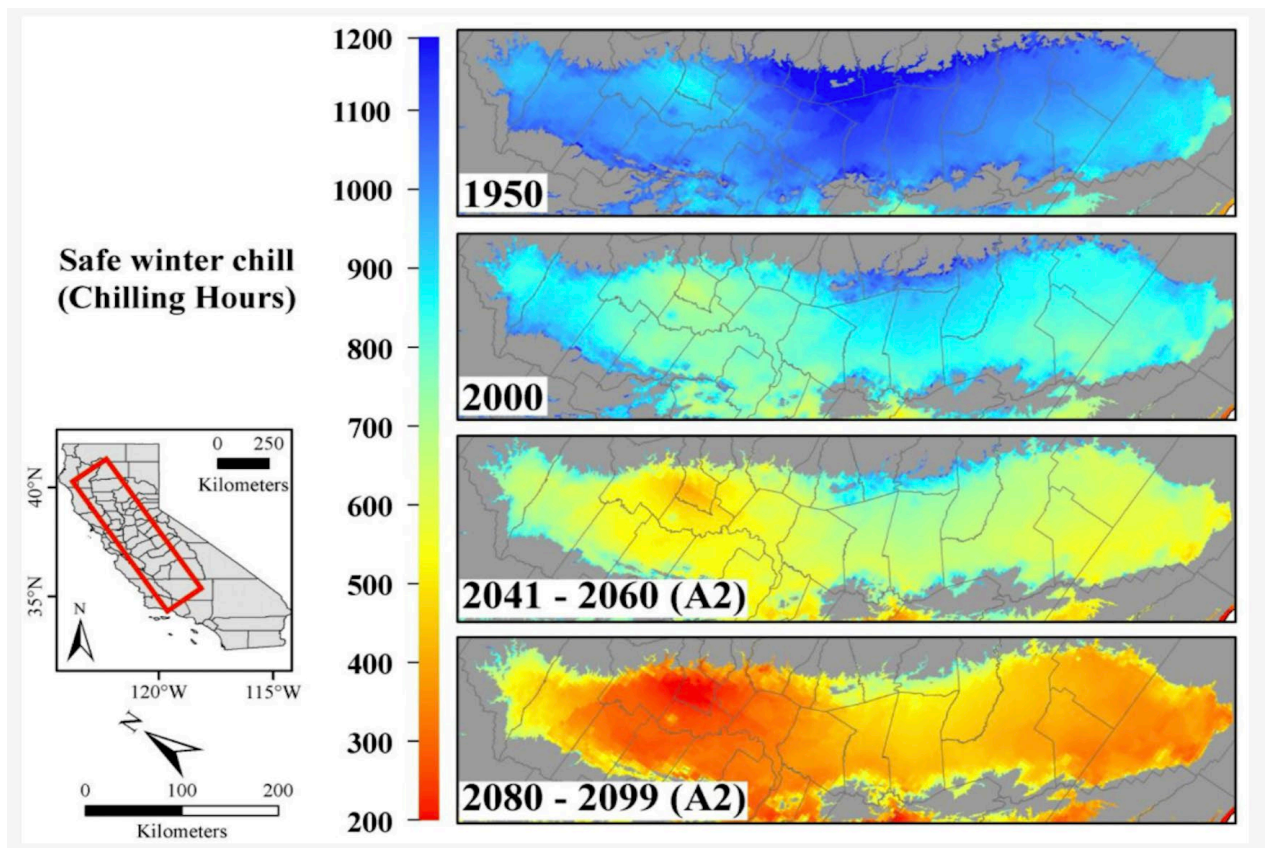

Figure 23: California Central Valley Winter Chill Hours in 1950, 2000, 2041–2060, and 2080–2099

232. Increases in invasive pests, changes to plant and pest interactions, and increases in plant and animal diseases in agriculture are some additional potential impacts from climate change. University of California researchers have indicated that due to climate change, by 2050, yields are projected to decline by 40% for avocados and 20% for almonds, table grapes, oranges, and walnuts. In 2021, drought resulted in the fallowing of nearly 400,000 acres of fields. Direct crop revenue losses were approximately \$962 million, and total economic impacts were more than \$1.7 billion, with over 14,000 full- and part-time job losses. During the 2011–2017 drought, California’s agricultural industry suffered at least \$5 billion in losses. Because California feeds not only its own residents, but the entire U.S. and other countries as well, production declines could lead to food shortages and higher prices.

7. Sea Level Rise, Coastal Flooding and Coastal Erosion

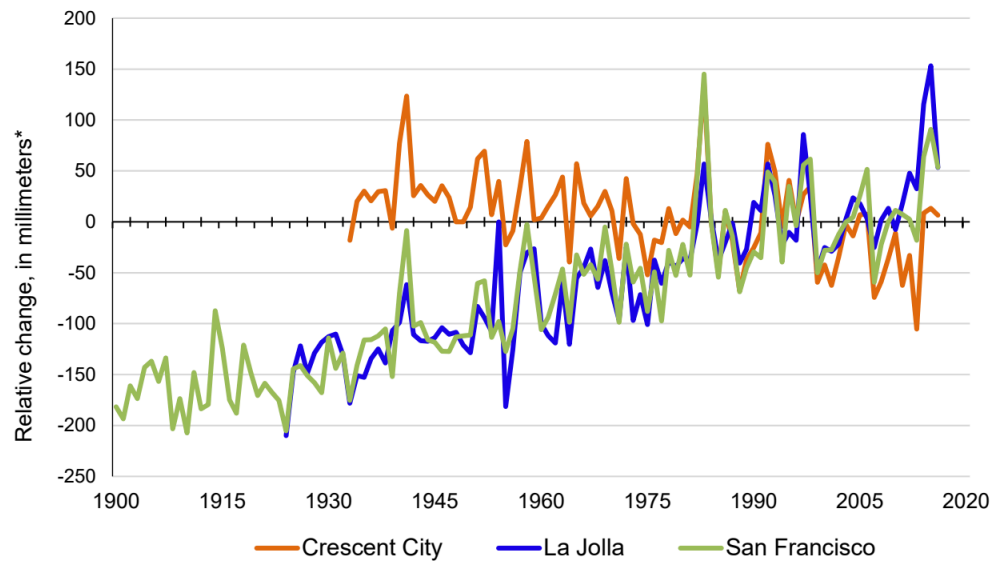

233. Climate change causes sea level rise in two primary ways: (1) by causing the melting of ice sheets and glaciers, and (2) by warming seawater, which consequently expands. Sea level

1 rise is already accelerating along the California coast and will continue to rise substantially over
2 the twenty-first century, threatening coastal communities, natural resources, cultural sites, and
3 infrastructure.

4 234. California has approximately 1,100 miles of coastline. California's 19 coastal
5 counties are home to 68% of its people, 80% of its wages, and 80% of its GDP.¹⁵² The sea level
6 along California's coasts has risen nearly eight inches in the past century and is projected to rise
7 by 3.5 feet, and as much as 6.6 feet under extreme scenarios, by the end of the century. As the
8 Earth gradually warms, sea level rise will continue to threaten coastal communities and
9 infrastructure through more frequent flooding (followed by permanent inundation of low-lying
10 areas), and increased erosion of cliffs, bluffs, dunes, and beaches. Across California, accelerating
11 sea level rise will cause an exponential increase in the frequency of coastal flooding events,
12 doubling with approximately every two to four inches of sea level rise. Sea level rise could put
13 600,000 people at risk of flooding by the year 2100, and threaten \$150 billion in property and
14 infrastructure, including roadways, buildings, hazardous waste sites, power plants, and parks and
15 tourist destinations. Coastal erosion could have a significant impact on California's ocean-
16 dependent economy, which is the nation's largest, and estimated to exceed \$45 billion per year.
17 Critical infrastructure located on the shore, such as wastewater treatment plants, power stations,
18 and transportation corridors, will also be affected. Sea level rise also pushes shallow groundwater
19 closer to the surface, a process that may release contaminants buried in the soil.

20 235. Sea levels along the California coast have generally risen over the past century,
21 except along the far north coast where uplift of the land surface has occurred due to the
22 movement of the Earth's plates, as illustrated in the following chart.

23
24
25
26
27 _____
28 ¹⁵² California's gross domestic product, or GDP, is the value of all goods and services
produced in California.

* Relative to tidal datum (reference point set by the NOAA)

Figure 24: Annual Mean Sea Level Trends

236. Coastal wave events and high tides, in combination with current and rising sea levels, will increase flood impacts on land, which will exacerbate the impact on coastal assets. Rising sea levels may also contaminate coastal groundwater aquifers and raise groundwater tables, causing increased flooding leading to impacts that will, among other things, further damage buried and low-lying infrastructure.

237. Coastal recreation and tourism are vulnerable to repeated and increasing disruptions from sea level rise, flooding, and erosion. Accelerated erosion and flooding diminish the number and quality of beaches. Beach closures have already occurred in California because of erosion and high storm surges, and such closures impact tourism and result in natural resource damage. Areas including some state parks and beaches will suffer further erosion due to sea level rise.

238. Rising water levels and increased storm activity will increase coastal erosion, impacting beaches and cliffs throughout the state. For example, a projected 31–67% of Southern California beaches are projected to completely erode by the end of the century if adaptation actions are not implemented.

239. Billions of dollars’ worth of real estate development, primarily residential properties, line the California seashore. All of California’s low-lying communities, as well as developments on cliffs, bluffs, dunes, or the beach itself, and their associated infrastructure, are vulnerable to

1 the impacts of a rising sea. King tides, and/or storm events—often accompanied by the
2 simultaneous arrival of large waves—have already impacted many of these areas repeatedly.

3 240. Saltwater intrusion from sea level rise is also expected to impair water quality in
4 coastal groundwater aquifers, as well as surface water supplies, as the salt front moves upstream.
5 Water quality will also be degraded as rising sea levels submerge sewer discharge points,
6 allowing contaminants to move into waterways and the surrounding environment. Industrial sites
7 located in coastal areas will be at a greater risk of pollutant discharge into the State’s waters.

8 241. Rising seas will inundate coastal infrastructure, including wastewater treatment plants
9 and toxic cleanup sites where contaminants may be mobilized and risk spreading contamination
10 to nearby vulnerable communities. Hundreds of such sites in the state are potentially vulnerable to
11 impacts from sea level rise.

12 242. Sea level rise in California not only threatens coastal communities, but also threatens
13 the health of the Sacramento-San Joaquin Delta, the heart of the California water supply system,
14 the source of water for 25 million Californians and millions of acres of prime farmland, and
15 essential habitat for imperiled native wildlife. Sea level rise in California could lead to flooding of
16 low-lying areas, loss of coastal wetlands, saltwater contamination of drinking water, impacts on
17 roads and bridges, and increased stress on levees. It may also require increased flows to prevent
18 saltwater intrusion into the Bay-Delta system.

19 **8. Ecosystem, Habitat, and Biodiversity Disruption**

20 243. California is one of the most biologically diverse regions of the world, with the
21 highest number of unique plant and animal species of all 50 states, and the greatest number of
22 endangered species. Moreover, due to its diverse topographic, geologic, and climate conditions,
23 California is one of 25 global biodiversity hotspots, where exceptional concentrations of endemic
24 species are experiencing significant habitat loss. California’s diverse climates are closely linked
25 to the State’s biodiversity; climate change is therefore expected to directly and indirectly impact
26 California’s terrestrial and marine habitats and species—and indeed already is impacting them.

27 244. Healthy ecosystems and biodiversity provide a plethora of direct and indirect benefits
28 to Californians and the State’s economy, such as clean air, clean water, crop pollination, and

1 recreational opportunities such as hunting, fishing, and wildlife viewing. These “ecosystem
2 services” are tied to biodiversity and will therefore be negatively impacted by climate change.

3 245. Climate change can affect biodiversity in many ways. For example, species can be
4 directly impacted, like salmon being exposed to warming stream temperatures that threaten their
5 survival. Species can also be affected indirectly, through climate-induced changes in food, water,
6 and habitat availability. Since ecosystems are highly interconnected, impacts to individual species
7 often have consequences for other species within the system.

8 246. As a result of climate change, California has seen, and will continue to see, the
9 following impacts on its ecosystems: shifts in species abundance and distributions; shifts in the
10 timing of important life-cycle events such as pollination, flowering, breeding, and migration; the
11 spread of invasive species and pests, which pose a threat to the survival of native species and
12 usually disrupt ecosystem processes; and habitat loss and species extinctions. Throughout
13 California, these types of changes have been observed across terrestrial, freshwater, estuarine, and
14 marine ecosystems.

15 247. More specifically, some of the effects of climate change on habitat and biodiversity in
16 California will include the following:

17 a. *Physiological stress on species due to changes in temperature and*
18 *precipitation.* Warming temperatures, declining snowpack, and earlier spring snowmelt runoff
19 create stresses on vegetation. This stress will cause shifts in geographic ranges, and will facilitate
20 the spread of invasive species, pests (such as the bark beetle), pathogens, and diseases that affect
21 ecosystems and species, and generally cause population declines. For example, tree deaths have
22 increased dramatically in California since the 2012-2016 drought; approximately 129 million
23 trees died in California between 2012 and 2017. Higher temperatures and decreased water
24 availability made the trees more vulnerable to insects and pathogen attacks. Some of the most
25 heavily impacted vegetation regions are predicted to be the Sierra Nevada foothills; the south
26 coast, including Los Angeles and San Diego; the deserts; and potentially the coast ranges north of
27 the San Francisco Bay Area. Similarly, in three study regions of the Sierra Nevada, the habitat
28

1 ranges of almost 75% of the small mammalian species and over 80% of the bird species surveyed
2 were observed to have shifted compared to a century ago.

3 b. *Impacts to timing of species' lifecycle phases due to shifting timing of climatic*
4 *events.* Changes in temperature, precipitation, food sources, competition for prey, and other
5 physical or biological elements may cause detrimental alterations in the timing of key life cycle
6 events for plants and animals, harming population health and further shifting the ranges where
7 these plants and animals can survive. For example, some butterfly species emerge at the same
8 time that their host plants flower. Warming temperatures are linked with earlier flowering times,
9 and if butterflies and host plants are not able to adapt to a shifting climate at the same rate,
10 butterflies may have insufficient food, and the host plants may lack pollinators. As another
11 example, shifts in suitable climatic conditions for seedling establishment for two common
12 California oak species have caused significant decreases in seedling “establishment windows,”
13 which is likely to bring about future population declines.

14 c. *Aquatic ecosystem and marine habitat impacts.* Shifts anticipated and already
15 observed in precipitation and water flow patterns have negatively impacted water quality (e.g.,
16 due to sedimentation or algal blooms) and habitat suitability. As one example, harmful algal
17 blooms are becoming more frequent and more intense across California as waters warm. These
18 blooms, which result from the overgrowth of algae, caused 18 human illnesses and 444 animal
19 illnesses in California in 2021 alone. Further, shifts in quantities of sediment in waterways have
20 significant consequences, including declining water quality due to increases in contaminants such
21 as pesticides, herbicides, nutrients, and mercury. Under current GHG emissions trajectories, 82%
22 of native California freshwater fishes have an increased probability of becoming extinct by 2100;
23 these include many species that are already at risk and listed as species of special concern or
24 species that are endangered, including salmon and steelhead trout. In contrast, non-native species
25 are thriving in the increasingly warm waters of California's rivers and reservoirs, taking the place
26 of many native fishes. Further, ocean acidification and warming have a broad variety of effects,
27 negatively impacting everything from copepods at the base of the food chain to Chinook salmon
28 and sea lion pup births.

1 248. The State has incurred damages as a direct and proximate result of Defendants’
2 conduct. The State has planned and is planning, at significant expense, adaptation and mitigation
3 strategies to address climate change-related impacts in order to preemptively mitigate and/or
4 prevent injuries to itself and its residents.

5 249. The scale of transformation needed over this decade to avoid the worst impacts of
6 climate change is extraordinary. The State has made investments of a historic scale to advance the
7 all-of-government approaches necessary to avert the worst impacts of climate change. For
8 example, California’s \$52.2 billion Climate Change Commitment for 2021 through 2027 includes
9 \$10 billion for zero-emission vehicles, \$2.1 billion for clean energy investments, \$13.8 billion for
10 programs that reduce emissions from the transportation sector, such as improving public
11 transportation while also funding walking, biking, and adaptation projects, and \$13.2 billion for
12 wildfire risk reduction, drought mitigation, extreme heat resilience, and nature-based solutions.

13 250. The State has spent tens of billions of dollars to adapt to climate change and address
14 the damages climate change has caused so far, and the State will need to spend multiples of that
15 figure in the years to come.

16 251. Defendants’ tortious and deceptive conduct was a substantial factor in bringing about
17 these and other climate-related injuries suffered by the State, including harms to its infrastructure,
18 environment, socioeconomic condition, and public health, that it has endured, and foreseeably
19 will endure, due to the climate crisis. Moreover, the brunt of these injuries and harms will fall on
20 frontline communities, as climate change exacerbates existing public health and environmental
21 disparities.

22 252. Defendants’ tortious and deceptive conduct as described herein is therefore an actual,
23 direct, and proximate substantial-factor cause of the State’s climate crisis-related injuries and
24 brought about or helped to bring about those injuries. Such injuries include, but are not limited to,
25 harms due to delayed responses to climate change caused by Defendants’ behavior.

26
27
28

1 **V. CAUSES OF ACTION**

2 **FIRST CAUSE OF ACTION**

3 **PUBLIC NUISANCE**

4 (Civil Code Sections 3479, 3480, and 3494)

5 (Against All Defendants)

6 253. Plaintiff re-alleges and incorporates by reference the allegations in each of the
7 preceding paragraphs as though fully set forth herein.

8 254. Under Civil Code section 3479, a “nuisance” is “anything which is injurious to
9 health,” including, but not limited to, “an obstruction to the free use of property, so as to interfere
10 with the comfortable enjoyment of life or property,” or anything which “unlawfully obstructs the
11 free passage or use, in the customary manner, of any navigable lake, or river, bay, stream, canal,
12 or basin, or any public park, square, street, or highway.”

13 255. Under Civil Code section 3480, a “public nuisance” is “one which affects at the same
14 time an entire community or neighborhood, or any considerable number of persons, although the
15 extent of the annoyance or damage inflicted upon individuals may be unequal.”

16 256. Pursuant to Civil Code section 3494, a “public nuisance may be abated by any public
17 body or officer authorized thereto by law.” As courts have recognized, the Attorney General is
18 such a public officer authorized to bring an action in the name of the People of the State of
19 California to abate a public nuisance.

20 257. Defendants, individually and in concert with each other, by their affirmative acts and
21 omissions, have created, contributed to, and assisted in creating harmful climate-related
22 conditions throughout California, including extreme heat, drought, increased wildfire risk, air
23 pollution, flooding, damage to agriculture, sea level rise, coastal erosion, habitat destruction, and
24 loss of ecosystems, with compounding effects in frontline communities. These climate-related
25 harms are injurious to health, indecent and offensive to the senses, and obstruct the free use of
26 property, so as to interfere with the comfortable enjoyment of life and property, and therefore
27 constitute a nuisance.

28

1 258. Defendants, and each of them, created, caused, contributed to, and assisted in the
2 creation of these and other climate-related harms in California by, among other things,
3 affirmatively promoting the sale and use of fossil fuel products in California which Defendants
4 knew would cause or exacerbate climate change and its impacts, including, without limitation
5 extreme heat, drought, increased wildfire risk, public health injuries, extreme weather, and sea
6 level rise.

7 259. The climate-related harms that Defendants created, caused, contributed to, and
8 assisted in the creation of, have substantially and unreasonably interfered with the exercise of
9 rights common to the public, including the public health, the public safety, the public peace, the
10 public comfort, and the public convenience. These interferences with public rights include,
11 among other things, affirmatively promoting the sale and use of fossil fuel products in California,
12 which Defendants knew would cause or exacerbate climate change and its impacts, including
13 without limitation extreme heat, drought, increased wildfire risk, public health injuries, extreme
14 weather, and sea level rise.

15 260. The climate-related harms that Defendants created, caused, contributed to, and
16 assisted in the creation of, have substantially and unreasonably interfered with the exercise of
17 rights common to the public, including the public health, the public safety, the public peace, the
18 public comfort, and the public convenience. These interferences with public rights include,
19 among other things:

20 a. Extreme heat events, which increase the risk of injury or death from
21 dehydration, heat stroke, heart attack, and respiratory problems;

22 b. Frequent and severe droughts, which can result in drinking water shortages and
23 land subsidence due to groundwater depletion;

24 c. Catastrophic wildfires, which destroy California's natural resources and
25 residents' homes, while also emitting dangerous pollutants into the air and severely
26 compromising air quality;

27
28

1 d. Increased smog from hotter temperatures, which damages lungs and increases
2 rates of childhood asthma, respiratory and heart disease, and death, and which reduces visibility
3 and obstructs scenic views;

4 e. Extreme winter storms, which cause flooding that can damage public
5 infrastructure, obstructing the free passage and use of property;

6 f. Damage to agriculture, including reduced crop yields that could lead to food
7 shortages;

8 g. Sea level rise, coastal inundation, and groundwater changes, which obstruct the
9 free passage and use of roads and property, impair water quality in groundwater aquifers, damage
10 critical public infrastructure such as power plants and airports, and lead to unprecedented and
11 dangerous storm surges that can cause injury or even deaths; and

12 h. Significant disruptions to California's ecosystems and biodiversity, including
13 the spread of invasive species and pests and the risk of extinction for California's native species.

14 261. The harms caused by Defendants' nuisance-creating conduct are extremely grave, and
15 far outweigh the social utility of that conduct.

16 262. The climate-related harms that Defendants created, caused, contributed to, and
17 assisted in the creation of are present throughout California, and therefore affect a considerable
18 number of persons in California.

19 263. The climate-related harms that Defendants created, caused, contributed to, and
20 assisted in the creation of continue to harm to the State and its people into the present day, and
21 will continue to harm the State and its people many years into the future.

22 264. As a direct and proximate result of Defendants' acts and omissions, the State will be
23 required to expend significant public resources to mitigate the impacts of climate-related harms
24 throughout California.

25 265. As a direct and proximate result of Defendants' acts and omissions, Californians have
26 sustained and will sustain injuries to public health, safety, and welfare; the loss of use and
27 enjoyment of natural resources; and obstruction to the free use of property, harms for which
28 Defendants are jointly and severally liable.

1 266. Defendants’ acts and omissions have caused or threaten to cause injuries to people,
2 properties, and natural resources in California that are indivisible.

3 267. The State seeks abatement of the public nuisance caused by Defendants.

4 268. The State requests that this Court order Defendants, and each of them jointly and
5 severally, to abate the nuisance, including by making payments into an abatement fund to address
6 the public nuisance.

7 **SECOND CAUSE OF ACTION**

8 **ACTION FOR EQUITABLE RELIEF FOR POLLUTION, IMPAIRMENT, AND**
9 **DESTRUCTION OF NATURAL RESOURCES**

10 (Government Code Section 12607)

11 (Against All Defendants)

12 269. Plaintiff re-alleges and incorporates by reference the allegations in each of the
13 preceding paragraphs as though fully set forth herein.

14 270. Government Code section 12607 authorizes the Attorney General to “maintain an
15 action for equitable relief in the name of the People of the State of California against any person
16 for the protection of the natural resources of the state from pollution, impairment, or destruction.”

17 271. “Natural resource” is defined to include “land, water, air, minerals, vegetation,
18 wildlife, silence, historic or aesthetic sites, or any other natural resource which, irrespective of
19 ownership contributes, or in the future may contribute, to the health, safety, welfare, or enjoyment
20 of a substantial number of persons, or to the substantial balance of an ecological community.”

21 (Gov. Code, § 12605.)

22 272. As a result of Defendants’ misconduct, climate-related conditions are polluting,
23 impairing, and destroying the State’s natural resources.

24 273. As a result of Defendants’ misconduct, climate-related conditions are polluting,
25 impairing, and destroying “other natural resources” as described in the statute which,
26 “irrespective of ownership contribute, or in the future may contribute, to the health, safety,
27 welfare, or enjoyment of a substantial number of persons, or to the substantial balance of an
28 ecological community.” (Gov. Code, § 12605.)

1 274. This pollution, impairment, and destruction of natural resources, including water,
2 wildlife, and other natural resources, is continuing in nature.

3 275. Defendants, and each of them, have engaged in and continue to engage in, conduct
4 that caused or contributed to the pollution, impairment, and destruction of natural resources,
5 including water resources, wildlife, and other natural resources. The acts and practices engaged in
6 by Defendants that polluted, impaired, and destroyed natural resources include the following:

7 a. affirmatively and knowingly promoting the sale and use of fossil fuel products
8 in California which Defendants knew would cause or exacerbate climate change and its impacts,
9 including extreme heat, drought, extreme weather, and sea level rise;

10 b. affirmatively and knowingly concealing the hazards that Defendants knew
11 would result from the use of their fossil fuel products by misrepresenting and casting doubt on the
12 integrity of scientific information related to climate change;

13 c. affirmatively promoting fossil fuel products for uses that Defendants knew
14 would be dangerous and cause harm to consumers, the public, and the State;

15 d. disseminating and funding the dissemination of information intending to
16 mislead customers, consumers, lawmakers, and the public regarding the known and foreseeable
17 risks of climate change and its consequences that follow from the normal, intended use of fossil
18 fuel products;

19 e. delaying the development of viable clean energy alternatives by preventing
20 customers, the media, policymakers, and the public from having access to full and accurate
21 information material to their energy purchasing decisions, thereby causing the emission of vast
22 quantities of greenhouse gases into the atmosphere;

23 f. failing to warn the public about the hazards associated with the use of fossil
24 fuel products; and

25 g. deceptively marketing their products as environmentally beneficial or benign
26 when in reality those products contribute to climate change and are harmful to the health of the
27 planet and its people.

28

1 when in reality those products contribute to climate change and are harmful to the health of the
2 planet and its people;

3 b. Deceptively promoting natural gas as a climate-friendly or environmentally
4 friendly fuel, and/or as “clean” or “cleaner” than other fossil fuels, when in reality natural gas
5 contributes to climate change and is harmful to the health of the planet and its people;

6 c. Deceptively marketing their companies and their products as contributing to
7 solutions to climate change when in reality their investments in clean energy and alternative fuels
8 pale in comparison to their investments in expanding fossil fuel production, and those alternative
9 fuels, such as natural gas, contribute to climate change; and

10 d. Misleadingly promoting their companies as being in alignment with
11 international goals to reduce carbon emissions and reach net-zero emissions, when in reality they
12 are investing in maintaining and/or expanding their fossil fuel businesses.

13 **FOURTH CAUSE OF ACTION**

14 **MISLEADING ENVIRONMENTAL MARKETING**

15 (Business and Professions Code Section 17580.5)

16 (Against All Defendants)

17 282. Plaintiff re-alleges and incorporates by reference the allegations in each of the
18 preceding paragraphs as though fully set forth herein.

19 283. Defendants, and each of them, have made environmental marketing claims that are
20 untruthful, deceptive, and/or misleading, whether explicitly or implicitly, in violation of Business
21 and Professions Code section 17580.5.

22 284. Such misleading environmental marketing claims include, but are not limited to, such
23 deceptive representations as:

24 a. Deceptively marketing fossil fuel products claimed to be “low carbon,”
25 “emissions-reducing,” “clean” and/or “green,” or otherwise environmentally beneficial or benign,
26 when in reality those products contribute to climate change and are harmful to the health of the
27 plant and its people;

28

1 Fuel Defendants had control over, and a substantial ability to influence, the manufacturing and
2 distribution processes of their affiliates and subsidiaries.

3 291. Throughout the times at issue, the Fossil Fuel Defendants individually and
4 collectively knew or should have known that fossil fuel products, whether used as intended or
5 used in a foreseeable manner, release greenhouse gases into the atmosphere, inevitably causing,
6 among other things, global warming, heat waves, more frequent and extreme droughts,
7 precipitation events, sea level rise, and the associated consequences of those physical and
8 environmental changes.

9 292. Throughout the times at issue and continuing today, fossil fuel products presented,
10 and still present, a substantial danger to the State and its people through the climate harms
11 described herein, whether used as intended or used in a reasonably foreseeable manner.

12 293. Throughout the times at issue, the ordinary consumer would not recognize that the
13 use of fossil fuel products causes global and localized changes in climate, and consequent injuries
14 to California, its communities, and its resources, as described herein.

15 294. Throughout the times at issue, the Fossil Fuel Defendants individually and in concert
16 widely disseminated false, and misleading marketing materials; cast doubt upon the consensus on
17 climate change within the scientific community at the time; advanced pseudo-scientific theories
18 of their own; and developed public relations campaigns and materials that prevented reasonable
19 consumers from recognizing the risk that fossil fuel products would cause grave climate harms,
20 including those described herein.

21 295. Notwithstanding the Fossil Fuel Defendants' superior knowledge of the risks posed
22 by their fossil fuel products, the Fossil Fuel Defendants, and each of them, failed to adequately
23 warn customers, consumers, elected officials, and regulators of the known and foreseeable risks
24 of climate change and the consequences that inevitably follow from the normal, intended use of
25 the Fossil Fuel Defendants' fossil fuel products.

26 296. Any warnings that the Fossil Fuel Defendants might have disseminated were rendered
27 ineffective and inadequate by their false and misleading public statements about the dangers of
28

1 their fossil fuel products, and their widespread and longstanding efforts to conceal and
2 misrepresent the dangers inherent in the use of their fossil fuel products.

3 297. Had the Fossil Fuel Defendants provided adequate warnings, their fossil fuel products
4 would not have had widespread acceptance in the marketplace, and alternatives to fossil fuel
5 products would have been developed sooner. In addition, if the Fossil Fuel Defendants had
6 adequately warned of the adverse impacts to public health and the environment caused by the
7 ordinary and foreseeable use of their fossil fuel products, the State and its residents would have
8 taken measures to avoid or lessen those impacts in California.

9 298. The Fossil Fuel Defendants' acts and omissions as alleged herein are indivisible
10 causes of the State's injuries as alleged herein.

11 299. The Fossil Fuel Defendants' wrongful conduct was oppressive, malicious, and
12 fraudulent, in that their conduct was willful, intentional, and in conscious disregard for the rights
13 of others. Defendants' conduct was so vile, base, and contemptible that it would be looked down
14 upon and despised by reasonable people, justifying an award of punitive and exemplary damages,
15 in an amount subject to proof.

16 300. As a direct and proximate result of the Fossil Fuel Defendants' failure to warn, their
17 fossil fuel products caused the State to sustain the injuries and damages set forth in this
18 Complaint, and will cause future injuries and damages to State as set forth in this Complaint,
19 including, without limitation, damage to State property, State infrastructure, and natural
20 resources. The State seeks compensatory damages for these injuries in an amount subject to
21 proof.

22 **SEVENTH CAUSE OF ACTION**

23 **NEGLIGENT PRODUCTS LIABILITY**

24 (Failure to Warn)

25 (Against All Fossil Fuel Defendants)

26 301. Plaintiff re-alleges and incorporates by reference the allegations in each of the
27 preceding paragraphs as though fully set forth herein.

28

1 302. At all relevant times the Fossil Fuel Defendants, and each of them, extracted, refined,
2 formulated, designed, packaged, manufactured, merchandised, advertised, promoted, and/or sold
3 fossil fuel products, which were intended by the Fossil Fuel Defendants to be combusted for
4 energy, refined into petrochemicals, and refined and/or incorporated into petrochemical products
5 including fuels and plastics. The Fossil Fuel Defendants placed these fossil fuel products into the
6 stream of commerce.

7 303. The Fossil Fuel Defendants, and each of them, heavily marketed, promoted, and
8 advertised fossil fuel products and their derivatives, which were sold or used by their respective
9 affiliates and subsidiaries. The Fossil Fuel Defendants received direct financial benefit from their
10 affiliates' and subsidiaries' sales of fossil fuel products. The Fossil Fuel Defendants' roles as
11 promoters and marketers were integral to their respective businesses and a necessary factor in
12 bringing fossil fuel products and their derivatives to the consumer market, such that the Fossil
13 Fuel Defendants had control over, and a substantial ability to influence, the manufacturing and
14 distribution processes of their affiliates and subsidiaries.

15 304. Throughout the times at issue, the Fossil Fuel Defendants individually and
16 collectively knew or should have known that fossil fuel products, whether used as intended or in a
17 foreseeable manner, release greenhouse gases into the atmosphere, inevitably causing, among
18 other things, global warming, more frequent and extreme heat waves, more frequent and extreme
19 droughts, injuries to public health, more frequent and extreme precipitation events, sea level rise,
20 and the associated consequences of those physical and environmental changes.

21 305. Throughout the times at issue and continuing today, fossil fuel products presented and
22 still present a substantial danger to the State and its people through the climate effects described
23 herein, whether used as intended or in a reasonably foreseeable manner.

24 306. Throughout the times at issue, the ordinary consumer would not recognize that the
25 use of fossil fuel products causes global and localized changes in climate, and consequent injuries
26 to California, its communities, and its resources, as described herein.

27 307. Throughout the times at issue, the Fossil Fuel Defendants individually and in concert
28 widely disseminated false and misleading marketing materials; cast doubt in the public's mind

1 about the consensus on climate change within the scientific community at the time; advanced
2 pseudo-scientific theories of their own; and developed public relations campaigns and materials
3 that prevented reasonable consumers from recognizing the risk that fossil fuel products would
4 cause grave climate changes, including those described herein.

5 308. Notwithstanding the Fossil Fuel Defendants' superior knowledge of the risks posed
6 by their fossil fuel products, the Fossil Fuel Defendants, and each of them, failed to adequately
7 warn customers, consumers, elected officials, and regulators, including in California, of the
8 known and foreseeable risks of climate change and the consequences that inevitably follow from
9 the normal, intended use of the Fossil Fuel Defendants' fossil fuel products.

10 309. Given the grave dangers caused by normal or foreseeable use of fossil fuel products
11 as described herein, a reasonable extractor, refiner, formulator, designer, manufacturer,
12 merchandiser, advertiser, promoter, or seller responsible for introducing fossil fuel products into
13 the stream of commerce, would have warned of those known and inevitable climate effects.

14 310. Any warnings that the Fossil Fuel Defendants might have disseminated were rendered
15 ineffective and inadequate by their false and misleading public statements about the dangers of
16 their fossil fuel products, and their widespread and longstanding efforts to conceal and
17 misrepresent the dangers inherent in the use of their fossil fuel products.

18 311. Had the Fossil Fuel Defendants provided adequate warnings, their fossil fuel products
19 would not have had widespread acceptance in the marketplace, and alternatives to fossil fuel
20 products would have been developed sooner. In addition, if the Fossil Fuel Defendants had
21 adequately warned of the adverse impacts to public health and the environment caused by the
22 ordinary and foreseeable use of their fossil fuel products, the State and its residents would have
23 taken measures to avoid or lessen those impacts in California.

24 312. The Fossil Fuel Defendants' acts and omissions as alleged herein are indivisible
25 causes of the State's injuries as alleged herein.

26 313. The Fossil Fuel Defendants' wrongful conduct was oppressive, malicious, and
27 fraudulent, in that their conduct was willful, intentional, and in conscious disregard for the rights
28 of others. Defendants' conduct was so vile, base, and contemptible that it would be looked down

1 upon and despised by reasonable people, justifying an award of punitive and exemplary damages
2 in an amount subject to proof.

3 314. As a direct and proximate result of the Fossil Fuel Defendants' failure to warn, their
4 fossil fuel products caused the State to sustain the injuries and damages set forth in this
5 Complaint, and will cause future injuries and damages to State as set forth in this Complaint,
6 including, without limitation, damage to State property, State infrastructure, and natural
7 resources. The State seeks compensatory damages for these injuries in an amount subject to
8 proof.

9 **VI. PRAYER FOR RELIEF**

10 WHEREFORE, the State respectfully requests that the Court enter judgment in favor of the
11 State and against Defendants, jointly and severally, as follows:

12 1. Compelling Defendants to abate the ongoing public nuisance their conduct has
13 created in California, including by establishing and contributing to an abatement fund to pay the
14 costs of such abatement;

15 2. Granting any and all temporary and permanent equitable relief and imposing such
16 conditions upon the Defendants as are required to protect and/or prevent further pollution,
17 impairment and destruction of the natural resources of California, including the imposition of
18 such conditions upon the Defendants as are required to protect the natural resources of California
19 from pollution, impairment, or destruction, pursuant to Government Code sections 12607 and
20 12610;

21 3. Pursuant to Business and Professions Code section 17535, entering all orders
22 necessary to prevent Defendants, along with Defendants' successors, agents, representatives,
23 employees, and all persons who act in concert with Defendants, from making any false or
24 misleading statements in violation of Business and Professions Code section 17500 or 17580.5;

25 4. Pursuant to Business and Professions Code section 17203, entering all orders
26 necessary to prevent Defendants, along with Defendants' successors, agents, representatives,
27 employees, and all persons who act in concert with Defendants, from engaging in any act or
28

1 practice that constitutes unfair competition in violation of Business and Professions Code section
2 17200;

3 5. Pursuant to Business and Professions Code section 17535, entering all orders or
4 judgments as may be necessary to restore to any person in interest any money or other property
5 that Defendants may have acquired by violations of Business and Professions Code section 17500
6 or 17580.5;

7 6. Pursuant to Business and Professions Code section 17203, entering all orders or
8 judgments as may be necessary to restore to any person in interest any money or other property
9 that Defendants may have acquired by violations of Business and Professions Code section
10 17200;

11 7. Pursuant to Business and Professions Code section 17536, assessing a civil penalty of
12 two thousand five hundred dollars (\$2,500) against Defendants for each violation of Business and
13 Professions Code section 17500, as proved at trial;

14 8. Pursuant to Business and Professions Code section 17536, assessing a civil penalty of
15 two thousand five hundred dollars (\$2,500) against Defendants for each violation of Business and
16 Professions Code section 17580.5, as proved at trial;

17 9. Pursuant to Business and Professions Code section 17206, assessing a civil penalty of
18 two thousand five hundred dollars (\$2,500) against Defendants for each violation of Business and
19 Professions Code section 17200, as proved at trial;

20 10. Pursuant to Government Code section 12527.6, awarding disgorgement in an amount
21 according to proof;

22 11. Awarding compensatory damages in an amount according to proof;

23 12. Awarding punitive and exemplary damages in an amount according to proof;

24 13. Awarding to the Attorney General all costs of investigating and prosecuting the
25 public nuisance cause of action pursuant to Civil Code section 3494 and Government Code
26 section 12607 cause of action, including expert fees, reasonable attorney's fees, and costs in an
27 amount according to proof pursuant to Code of Civil Procedure section 1021.8;

28 14. Ordering that the State recover its costs of suit, including costs of investigation;

- 1 15. Ordering that the State receive all other relief to which it is legally entitled; and
- 2 16. Awarding such other relief that the Court deems just, proper, and equitable.
- 3 17. Notwithstanding the foregoing, the Counties of San Mateo, Marin, and Santa Cruz,
- 4 the Cities of Richmond, Imperial Beach, Santa Cruz, Oakland, and the City and County of San
- 5 Francisco (collectively, Local Entities) have filed pending actions against various fossil fuel
- 6 industry defendants for creating, contributing to, and/or assisting in the creation of climate
- 7 change-related harms within their respective jurisdictions (collectively, Pending Local
- 8 Actions).¹⁵³ The geographic areas covered by any claim or theory of recovery asserted by any
- 9 Local Entity in the Pending Local Actions are excluded from, and not subsumed by, this action,
- 10 except as to state-owned property and assets, and except as to harms or violations for which the
- 11 State has exclusive authority to recover damages or obtain injunctive relief. Nothing herein shall
- 12 be construed as abrogating the State’s jurisdiction, duties, or obligations as a trustee of state
- 13 resources, or permitting and regulatory authority under existing law over lands located within or
- 14 outside the Local Entities’ geographic limits.

15 **VII. REQUEST FOR JURY TRIAL**

16 Plaintiff respectfully requests that all issues presented by the above Complaint be tried by a

17 jury, with the exception of those issues that, by law, must be tried before the Court.

18

19

20

21

22

23 ¹⁵³ The Pending Local Actions are as follows: *People of the State of California & County*

24 *of San Mateo v. Chevron et al.* (San Mateo Super. Ct., No. 17-CIV-03222); *People of the State of*

25 *California & County of Marin v. Chevron et al.* (Marin Super. Ct., No. CIV1702586); *People of*

26 *the State of California & City of Imperial Beach v. Chevron et al.* (Contra Costa Super. Ct., No.

27 *MSC17-01227*); *People of the State of California & City of Santa Cruz v. Chevron et al.* (Santa

28 *Cruz Super. Ct., No. 17CV03243*); *People of the State of California & County of Santa Cruz v.*

Chevron et al. (Santa Cruz Super. Ct., No. 17CV03242); *People of the State of California & City*

of Richmond v. Chevron et al. (Contra Costa Super. Ct., No. MSC18-00055); *People of the State*

of California by and through the City Attorney for the City and County of San Francisco & City

and County of San Francisco v. BP et al. (S.F. Super. Ct., No. CGC-17-561370); and *People of*

the State of California by and through the City Attorney for the City of Oakland & City of

Oakland v. BP et al. (Alameda Super. Ct., No. RG17875889).
